Merging NS

- ▶ Possible R-process site
 - ▶ Lattimer+ 1977

- ▶ EM Counterpart of GR Wave
Li & Paczynski 98, Kulkarni 05, Metzger+10

Basic Picture

(From Metzger & Berger, 2012)

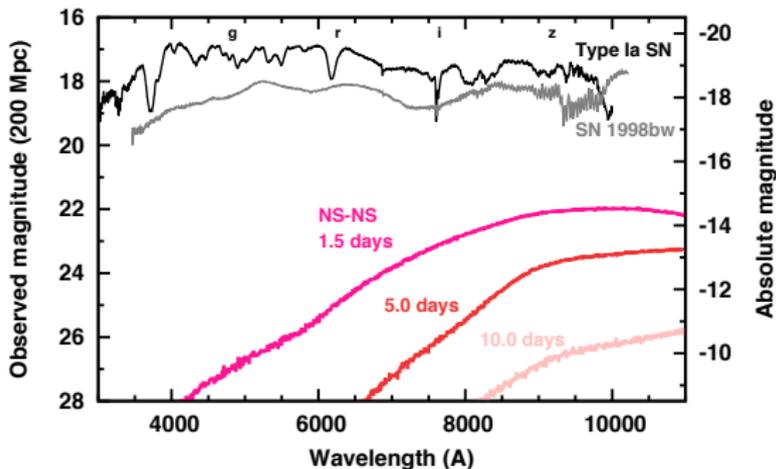

Bringing Coals to Newcastle

- ▶ Heard a talk by Masaomi Tanaka
- ▶ Asked about effect of edges
- ▶ Continua not included in Tanaka+ work
- ▶ Thought to use PHOENIX
- ▶ Put an excellent undergraduate, Patrick Vallely on project
- ▶ Have only proof of concept results

Event Rate/Brightness

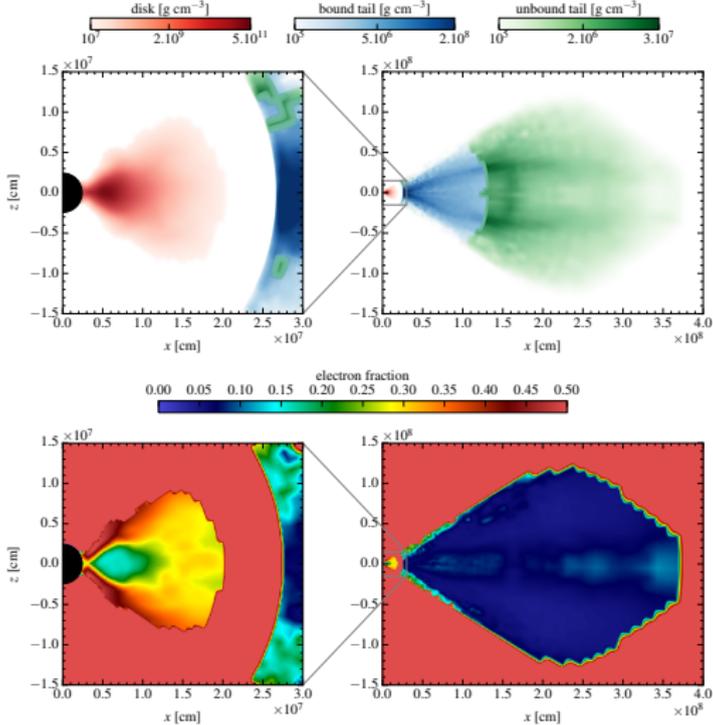

Tanaka+16

► $R_{\text{NSM}} \approx 1000 \text{ Gpc}^{-3} \text{ yr}^{-1}$

1D/3D Radiative Transfer

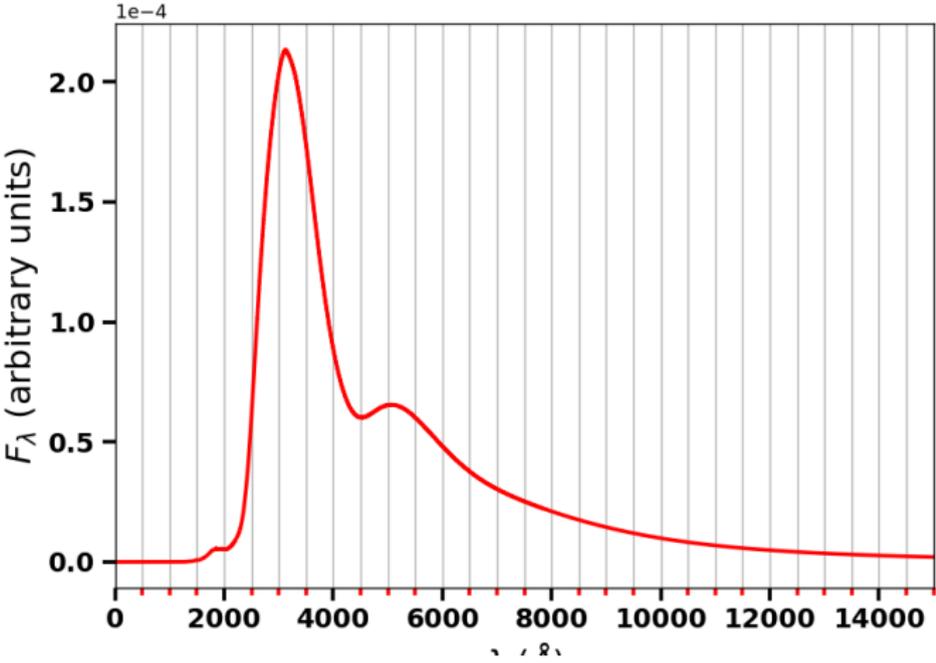

- ▶ PHOENIX/3D: general detailed 3D modeling of radiation fields in gaseous environments (stars, planets, supernova, AGN, rooms).
 - ▶ 3D spatial problem is 6D or 7D computational problem since must solve full phase-space solution of Boltzmann Equation
 - ▶ Full Special and General Relativistic
- ▶ Non-local thermodynamic equilibrium (NLTE)
- ▶ Model atoms for Lanthanides/Actinides
- ▶ multi-layered/scale domain decomposition
 - ▶ one for the data
 - ▶ one for the wavelength
 - ▶ another internal one for the RT

Preliminary Results

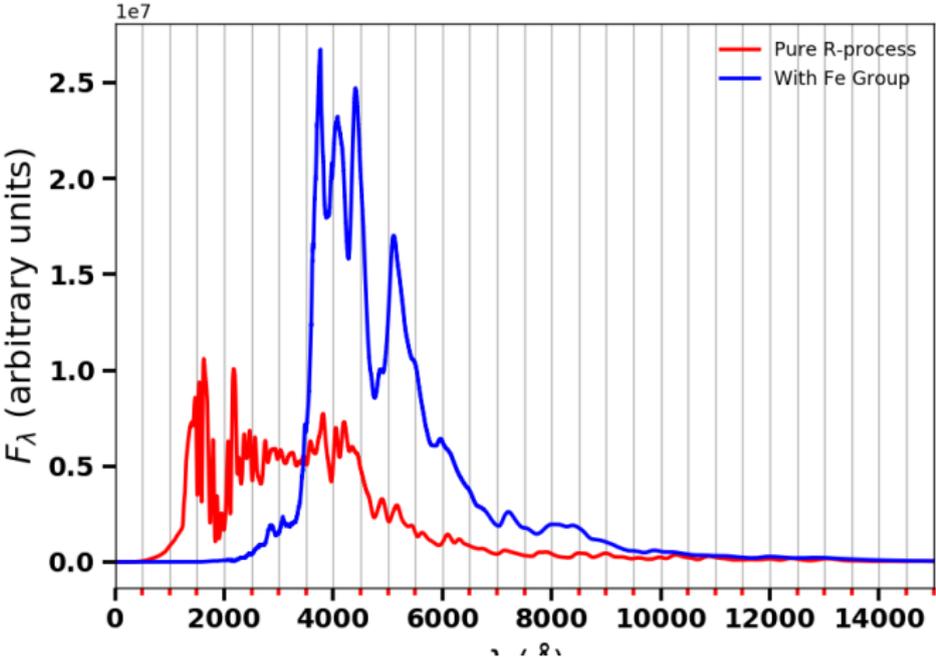

Patrick Vallely

- ▶ Very good undergrad
- ▶ Gone off to OSU to work with Kris Stanek
- ▶ Took “conditions” from Tanaka+16 (Dynamical Ejecta) and Kasen+15 (Disk Wind)
- ▶ 61 NLTE species
- ▶ All Disk Wind Models are Lanthanide poor per Kasen+15

Dynamical Ejecta Model

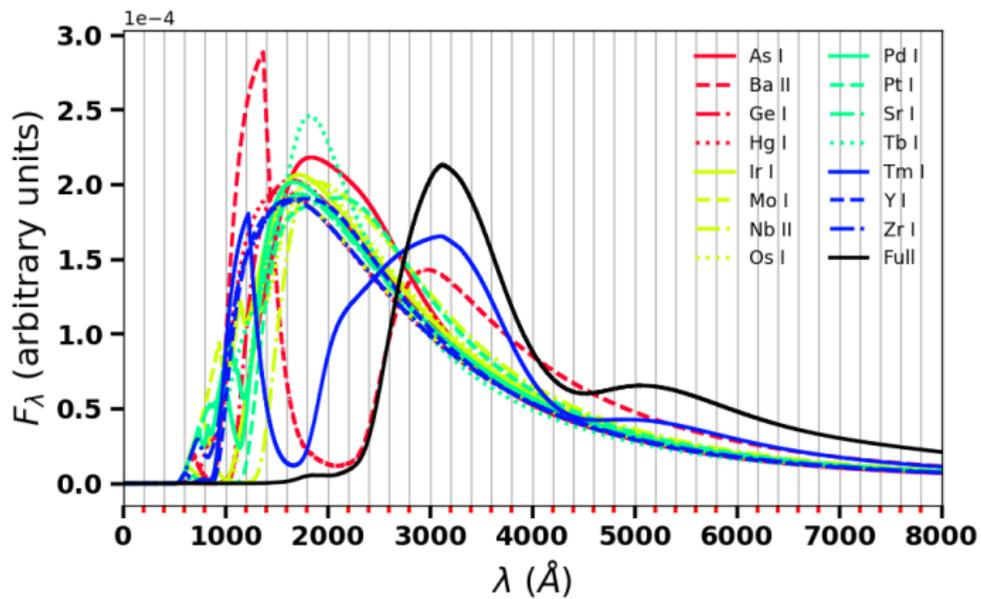

Disk Wind Model

Model Atoms

Summary

- ▶ PHOENIX has a role in predictions/analysis
- ▶ Need to explore parameter space more even in simple mode
- ▶ Can't do it alone, need Hydro models from Tanaka+, Kasen+, Metzger+, ...
- ▶ Need improved atomic data, e.g. Fontes+17, Tanaka+17. "Easy" to add
- ▶ Lots of interesting science here:
 - ▶ EM Counterparts for Gravitational Wave detections
 - ▶ R-process site
