Fermions (= matter): quarks and leptons, *3 generations*

Bosons (= interactions): gauge fields + Higgs (God's) boson

Glorious end of Fundamental Physics ?

Happily, some simple questions remain with our answer ...

- Baryon number violation and Baryogenesis
- Who is Dark Matter

Bright & Dark Sides of the Universe

Today's Universe: flat $\Omega_{\text{tot}} \approx 1$ (*inflation*) ... and multi-component:

- $\Omega_B \simeq 0.05$ observable matter: **electron, proton, neutron !**
- $\Omega_D \simeq 0.25$ dark matter: **WIMP? axion? sterile ν ? ...**
- $\Omega_\Lambda \simeq 0.70$ dark energy: **Λ -term? Quintessence?**
- $\Omega_R < 10^{-3}$ relativistic fraction: **relic photons and neutrinos**

Matter – dark energy coincidence: $\Omega_M/\Omega_\Lambda \simeq 0.45$, ($\Omega_M = \Omega_D + \Omega_B$)
 $\rho_\Lambda \sim \text{Const.}$, $\rho_M \sim a^{-3}$; *why* $\rho_M/\rho_\Lambda \sim 1$ – *just Today?*

Anthropic explanation: if not *Today*, then *Yesterday* or *Tomorrow*.

Baryon and dark matter Fine Tuning: $\Omega_B/\Omega_D \simeq 0.2$
 $\rho_B \sim a^{-3}$, $\rho_D \sim a^{-3}$: *why* $\rho_B/\rho_D \sim 1$ – *Yesterday Today & Tomorrow?*

Baryogenesis requires BSM Physics:
(**GUT-B, Lepto-B, Affleck-Dine, EW B ...**)

Dark matter requires BSM Physics:
(**Wimp, Wimpzilla, sterile ν , axion, ...**)

Different physics for B-genesis and DM?
Not very appealing: looks as Fine Tuning

Concepts of Mirror Matter:
What's Wrong with DM=MM?
(Everything must be as simple as possible. But not simpler.)

Zurab Berezhiani

Summary

Dark Matter Enigma

Mirror Matter

Asymmetric MM

Symmetric MM

Baryogenesis requires new physics: B–L violation

B & L can be violated only in higher order terms – but which ?

- $\frac{1}{M}(l\bar{\phi})(l\bar{\phi})$ ($\Delta L = 2$) – neutrino (seesaw) masses $m_\nu \sim v^2/M$

- $\frac{1}{M^5}(udd)(udd)$ ($\Delta B = 2$) – neutron-antineutron oscillation $n \rightarrow \bar{n}$

can originate from new physics related to scale $M \gg v_{EW}$ via seesaw

Bento, Z.B., 2005

Zurab Berezhiani

Summary

Dark Matter Enigma

Mirror Matter

Asymmetric MM

Symmetric MM

Dark Matter requires new physics: but which ?

Why $\Omega_D/\Omega_B \sim 1$? Or why $m_B \rho_B \sim m_X \rho_X$?

Visible matter from Baryogenesis (Sakharov)

B ($B - L$) & CP violation, Out-of-Equilibrium

$$\rho_B = m_B n_B, \quad m_B \simeq 1 \text{ GeV}, \quad \eta = n_B/n_\gamma \sim 10^{-9}$$

η is model dependent on several factors:

coupling constants and CP-phases, particle degrees of freedom, mass scales and out-of-equilibrium conditions, etc.

Dark matter: $\rho_D = m_X n_X$, but $m_X = ?$, $n_X = ?$
and why $m_X n_X = 5 m_B n_B$?

n_X is model dependent: DM particle mass and interaction strength (production and annihilation cross sections), freezing conditions, etc.

- | | | | |
|------------------|------------------------------|-------------------------------|-----------|
| • Axion | • $m_a \sim \text{meV}$ | $n_a \sim 10^4 n_\gamma$ | – CDM |
| • Neutrinos | • $m_\nu \sim \text{eV}$ | $n_\nu \sim n_\gamma$ | – HDM (×) |
| • Sterile ν' | • $m_{\nu'} \sim \text{keV}$ | $n_{\nu'} \sim 10^{-3} n_\nu$ | – WDM |
| • WIMP | • $m_X \sim \text{TeV}$ | $n_X \sim 10^{-3} n_B$ | – CDM |

$$n_{B'} \sim n_B$$

Natural?

Two different New Physics for B-genesis and DM ?

Or co-genesis by the same Physics explaining why $\Omega_{DM} \sim \Omega_B$?

Who are you, Mr. DM ?

- Have you relations with other (fundamental) problems? *Yes*
 - Do you manage to match your Ω to $5\Omega_B$? *Yes*
 - You must be cold. Or you are self-interacting and dissipative? *Yes*
 - You must be neutral. Or you have some tiny electric charges? *Yes*
 - Do you agree with astrophysical tests (BBN, CMB, LSS, ...) ? *Yes*
 - Can you form halos, stars & massive Black Holes? *Yes*
 - Are you directly detectable? Can you be converted in visible? *Yes*
 - Do you send indirect signals via cosmic rays & gammas? *Yes*
 - Can you be produced at LHC or other experimental facilities? *Yes*
- Let me guess, is your name Susy? *No! but I know her very well*
- Are you heavy or light? *Well, I'm just normal ...*
- Are you stable? *Stable enough ... but not immortal*
- Are you really dark? *Well, it's relative ... to someone I'm blond*
- . . . Oh, you look so similar to me !? *Are you MM ?*

Mirror parity and MFV

- Generically, SUSY flavor limits require $M_{SUSY} > 100$ TeV or so ...

But assuming the gauge symmetry $SU(3) \times \dots$ between 3 fermion families can be obtained quark-squark mass alignment:

universal relations
$$\tilde{m}_d^2 = m_0^2 + m_1^2(Y_d^\dagger Y_d) + m_2^2(Y_d^\dagger Y_d)^2,$$
$$A_d = A_0 Y_d + A_1 Y_d(Y_d^\dagger Y_d) \quad \text{etc.}$$

Z.B. 1996; Anselm, Z.B.1997; Z.B., Rossi 2001

later on (2002) coined as MFV Giudice et al., 2002

F -terms can be easily handled
gauge D - terms give problems

Flavon superpotential: $W_H = \mu\chi\bar{\chi} + a\chi^2 + a^*\bar{\chi}^3 + \text{h.c.}$

→ D -terms vanish because of mirror parity

If flavour symmetry $SU(3) \times \dots$ is shared between two sectors:

- Anomaly cancellation of between ordinary and mirror fermions
- SUSY flavor problem can be settled via MFV (safe D -terms)
- Interesting phenomena mediated by flavor gauge bosons: e.g. $K^0 \rightarrow K^{0'}$, $e\bar{\mu} \rightarrow \bar{e}'\mu'$ disappearance of muonium), etc.

LHC – run II: can SUSY be just around the corner?

possible. But not
simpler.)*

Zurab Berezhiani

Summary

Dark Matter
Enigma

Mirror Matter

Asymmetric MM

Symmetric MM

“Natural” SUSY (at scale ~ 100 GeV with 2 Higgses) is over !

One Higgs discovered by LHC perfectly fits the SM Higgs ...

already at LEP epoch many theorists felt $M_{SUSY} < 1$ TeV was problematic

- SUSY induced proton decay (D=5) requires $M_{SUSY} > 1$ TeV or so
- SUSY induced CP-violation: electron EDM, $M_{SUSY} > 1$ TeV or so
- But gauge coupling crossing requires $M_{SUSY} < 10$ TeV or so

Z.B., Chianese, Miele, Morisi, 2015

TeV scale SUSY remains best choice for Grand Hierarchy Problem:

– maybe SUSY is indeed just around the corner?

with a *little* (hierarchy) problem – Fine Tuning $\sim 10^{-2}$

$M_{\text{Higgs}}^2 \sim (100 \text{ GeV})^2$ and $M_{\text{SUSY}}^2 \geq (1 \text{ TeV})^2$ – Twin Higgs ?

Symmetric Mirror Matter: $DM \neq MM$?

Concepts of Mirror Matter: *What's Wrong with $DM=MM$? (Everything must be as simple as possible. But not simpler.)*

Zurab Berezhiani

Summary

Dark Matter Enigma

Mirror Matter

Asymmetric MM

Symmetric MM

For a long while mirror matter was not considered as a real candidate for dark matter: M world was naively taken to have not only exactly identical microphysics as O sector but also exactly identical cosmology:

- $T' = T, \quad g'_* = g_* \quad \rightarrow \quad \Delta N_\nu^{\text{eff}} = 6.15 \quad \text{vs.} \quad \Delta N_\nu^{\text{eff}} < 0.5 \quad (\text{BBN})$
- $n'_B/n'_\gamma = n_B/n_\gamma \quad (\eta' = \eta) \quad \rightarrow \quad \Omega'_B = \Omega_B \quad \text{vs.} \quad \Omega'_B/\Omega_B \simeq 5 \quad (\text{DM})$

IMirror World is colder? If $T'/T < 0.5$, BBN is OK but $\eta' = \eta$ implies $\Omega'_B = (n'_\gamma/n_\gamma)\Omega_B = (T'/T)^3\Omega_B \ll \Omega_B$

Then $DM \neq MM$

Such a mirror universe "can have no influence on the Earth and therefore would be useless and therefore does not exist"

S. Glashow (1987), citing Francesco Sizzi

Zurab Berezhiani

Summary

Dark Matter
Enigma

Mirror Matter

Asymmetric MM

Symmetric MM

It is enough to accept a Cosmological Paradigm:

(A) at the Big Bang (i.e. after inflation) the M world was born with smaller temperature than O world

(B) all interactions between M and O particles are feeble enough and cannot bring two sectors into equilibrium after reheating

(C) no entropy production by 1st order phase transitions which could heat M world: two systems evolve adiabatically over the universe expansion and their temperature ratio T'/T remains nearly constant.

If $x = T'/T \ll 1$, BBN is OK

(About why $\Omega'_B \simeq 5 \Omega_B$ in my next talk ...)

DM = MM: possible manifestations

A. Cosmological implications. $T'/T < 0.2$ or so, $\Omega'_B/\Omega_B = 1 \div 5$.

Mass fraction: H' – 25%, He' – 75%, and few % of heavier C', N', O' etc.

- Mirror baryons as **asymmetric/collisional/dissipative/atomic** dark matter: M hydrogen recombination and M baryon acoustic oscillations?
- Easier formation and faster evolution of stars: Dark matter disk? Galaxy halo as mirror elliptical galaxy? Microlensing ? Neutron stars? Black Holes? Binary Black Holes? Central Black Holes?

B. Direct detection. M matter can interact with ordinary matter e.g. via kinetic mixing $\epsilon F^{\mu\nu} F'_{\mu\nu}$, etc. Mirror helium as most abundant mirror matter particles (the region of DM masses below 5 GeV is practically unexplored). Possible signals from heavier nuclei C,N,O etc.

C. Oscillation phenomena between ordinary and mirror particles.

The most interesting interaction terms in \mathcal{L}_{mix} are the ones which violate B and L of both sectors. **Neutral particles, elementary (as e.g. neutrino) or composite (as the neutron or hydrogen atom) can mix with their mass degenerate (sterile) twins:** matter disappearance (or appearance) phenomena can be observable in laboratories.

In the Early Universe, these B and/or L violating interactions can give primordial baryogenesis and dark matter genesis, with $\Omega'_B/\Omega_B = 1 \div 5$.

Concepts of
Mirror Matter:

Zurab Berezhiani

Summary

Dark Matter
Enigma

Mirror Matter

Asymmetric MM

Symmetric MM

$DM = MM$: cosmological implications

$T'/T < 0.5$ is enough to concord with the BBN limits and do not affect standard primordial mass fractions: 75% H + 25% ^4He .

Cosmological limits are more severe, requiring $T'/T < 0.2$ or so.

This implies that M world is helium dominated: 25% H' + 75% $^4\text{He}'$.

Because of $T' < T$, the situation $\Omega'_B > \Omega_B$ becomes plausible in baryogenesis. So, M matter can be dark matter (my next talk)

Because of $T' < T$, in mirror photons decouple much earlier than ordinary photons, and after that M matter behaves for the structure formation and CMB anisotropies essentially as CDM. This concords M matter with WMAP/Planck, BAO, Ly- α etc. if $T'/T < 0.25$ or so.

Halo problem – if $\Omega'_B \simeq \Omega_B$, M matter makes ~ 20 % of DM, forming dark disk, while ~ 80 % may come from other type of CDM (WIMP?)

But perhaps 100 % ? if $\Omega'_B \simeq 5\Omega_B$: – M world is helium dominated, and the star formation and evolution can be much faster. Halos could be viewed as mirror elliptical galaxies, with our matter inside forming disks. MM is not only self-interacting (H' H' scattering, Bullet cluster, etc.) but it is dissipative – forms star and becomes collisionless (like CDM)

Key question: How fast the mirror star formation can be?

Mirror Matter

Asymmetric MM

Symmetric MM

Detection possibility of Mirror matter via photon kinetic mixing was recently studied in two works with DAMA Collaboration

For asymmetric MM, 2015

For symmetric MM, 2017

Photon-mirror photon kinetic mixing \rightarrow Rutherford-like scattering

...

Relative motion (rotation) of O and M matter drags electrons but not protons/ions which are much heavier. So circular electric currents emerge which can generate magnetic field. Modifying mirror Maxwell equations by the source (drag) term, one gets magnetic seed $B, B' \sim 10^{-15}$ G before dynamo, then amplified by dynamo. This mechanism can induce magnetic fields $\sim \mu\text{G}$ in very young galaxies

Z.B., Dolgov, Tkachev, 2013

MM capture by Earth can induce mirror magnetic field in the Earth, even bigger than ordinary 0.5 G.

be as simple as
possible. But not
simpler.)*

Zurab Berezhiani

Summary

Dark Matter
Enigma

Mirror Matter

Asymmetric MM

Symmetric MM

I discussed several issues of DM and MM (not all !)

$DM = MM$ seems OK to me (Good Policeman)

Why $DM \neq MM$? Next talk of Sasha Dolgov (Bad Policeman)

Two Policeman method (Good + Bad)
works well for finding who is delinquent

If you have some new information or ideas or criticism,
let's discuss during this Workshop

Thank You !
