

Jets in eA as a Probe of Hadronization and Energy Loss in the Cold Nuclear Medium

Brian Page

Brookhaven National Laboratory

INT – 2018

Outline

- General Jet Properties
- Underlying Event Study
- Substructure Investigation
 - Theory / Simulation Comparisons
 - Power Corrections
 - Quark / Gluon Discrimination

Relevant Subprocesses

Resolved

QCD-Compton (QCDC)

Photon-Gluon Fusion (PGF)

DIS

Simulation Details / Particle Cuts

- Electron – Proton events generated at $\sqrt{s} = 141$ GeV using PYTHIA (Full energy eRHIC design 20x250 GeV electron x proton)
- Cut on inelasticity: $0.01 \leq y \leq 0.95$
- Jet Algorithm: Anti- k_T ($R = 1.0, 0.8, 0.4$)
- Jets found in Breit or Lab frame
- Particles used in jet finding:
 - Stable
 - $p_T \geq 250$ MeV
 - $\eta \leq 4.5$
 - Parent cannot originate from scattered electron

PRD 96, 074035 (2017)

Jet p_T : How Low is Too Low?

Photon-Gluon Fusion: $Q^2 = 1-10 \text{ GeV}^2$

- In principle, can cluster particles and find 'jets' with very small p_T
- Where does theory break down?
- Would like to go as low as possible to get statistics

- Photon-gluon fusion jet p_T spectrum shown for two center of mass energies and two Q^2 ranges

- $\sqrt{s} = 141 \rightarrow 20 \times 250$

- $\sqrt{s} = 63 \rightarrow 10 \times 100$

Photon-Gluon Fusion: $Q^2 = 10-100 \text{ GeV}^2$

Jet p_T : How Low is Too Low?

Photon-Gluon Fusion: $Q^2 = 1-10 \text{ GeV}^2$

• $\sqrt{s} = 90 \rightarrow 20 \times 100$

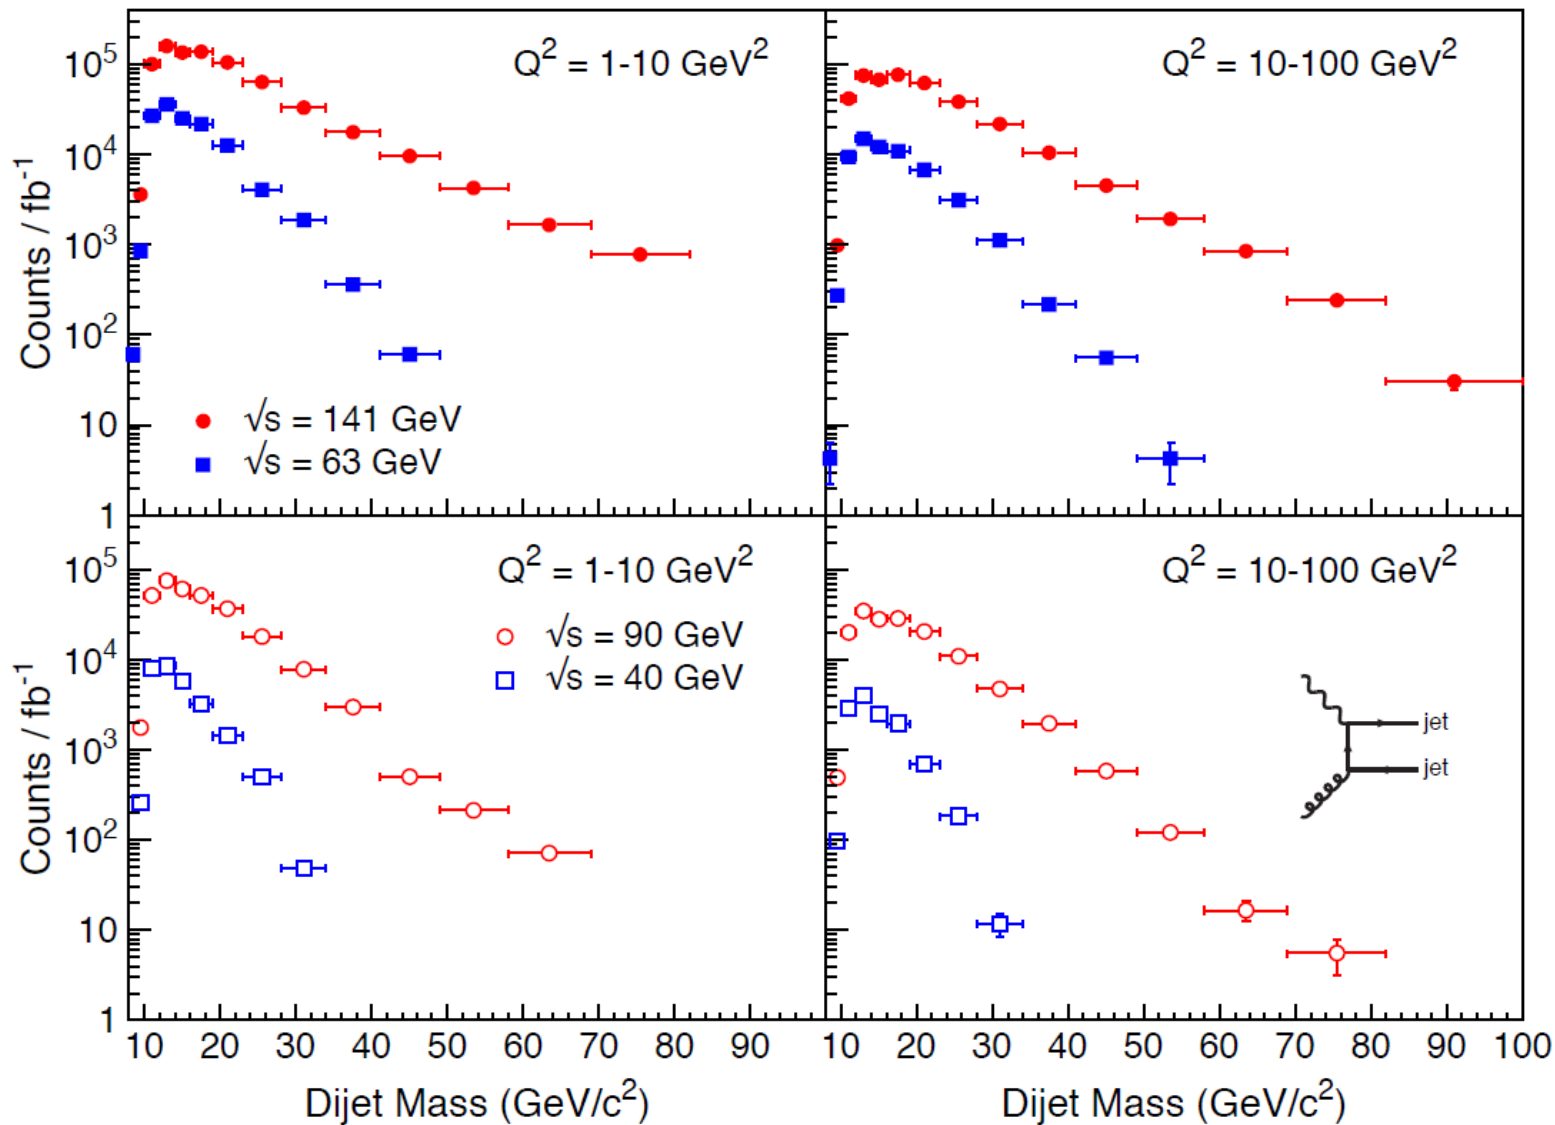

• $\sqrt{s} = 40 \rightarrow 10 \times 40$

Photon-Gluon Fusion: $Q^2 = 10-100 \text{ GeV}^2$

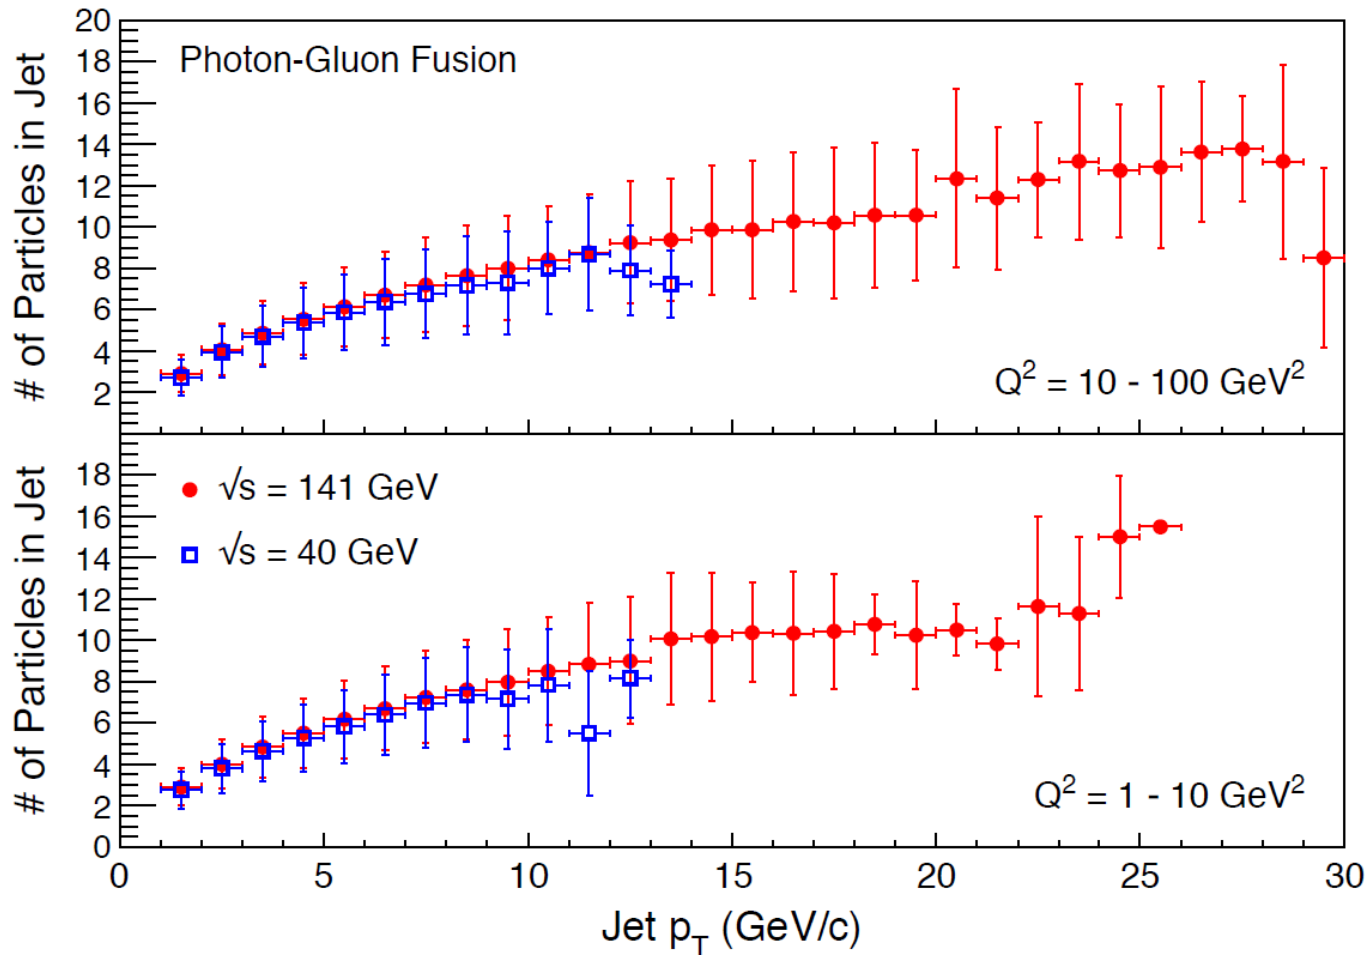

- The lower energies that come with running heavy ions will make jet measurements challenging from a statistics and kinematic reach standpoint
- Being able to push to lower p_T will be even more essential than for ep

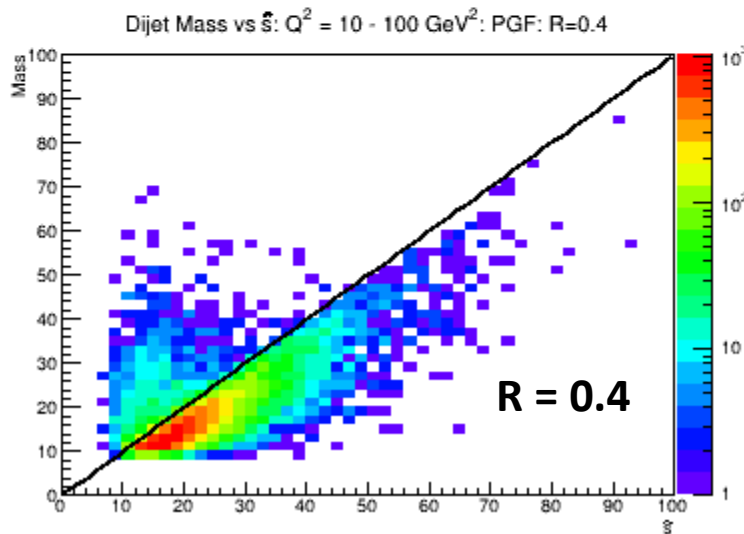

Dijet Mass Spectra

Jet Particle Content

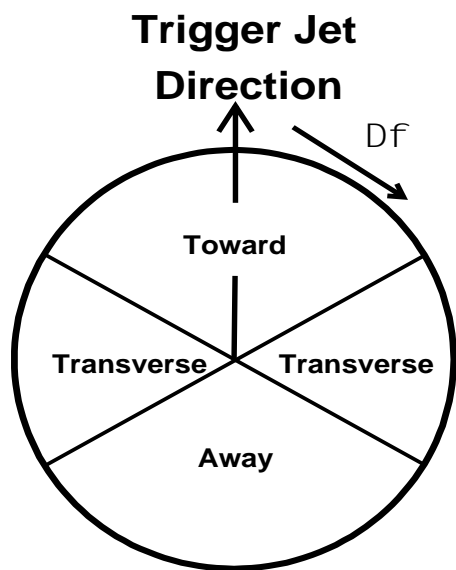

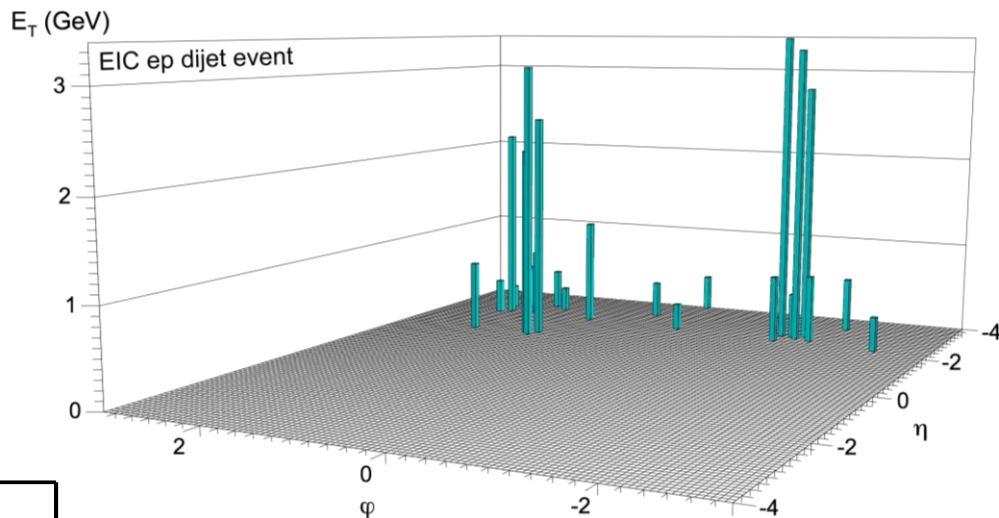

Jet Radius Considerations

- What size radius is optimal?
- Dijet mass reproduces partonic \hat{s} better with larger radius
- Other analyses may benefit from smaller radii

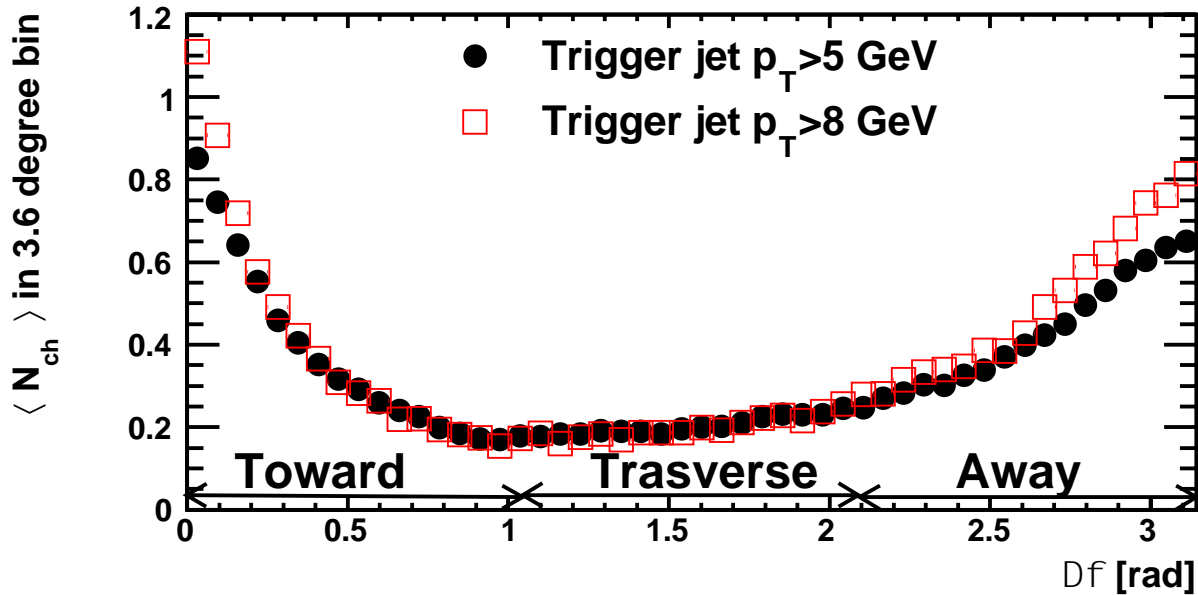

Underlying Event Study

- ep events are expected to be relatively clean, with moderate underlying event activity
- Want to systematically quantify the amount of underlying event present in a typical event

- Divide event into regions based on position of a trigger jet
- Transverse regions sensitive to underlying event contribution
- For this study: Dijet events from Resolved, QCDC, and PGF subprocesses; $Q^2 < 1 \text{ GeV}^2$; $p_{T1} > 5$, $p_{T2} > 4.5 \text{ GeV}/c$

Underlying Event Characteristics

- Plot average number of charged particles per event as a function of azimuthal angle from trigger jet

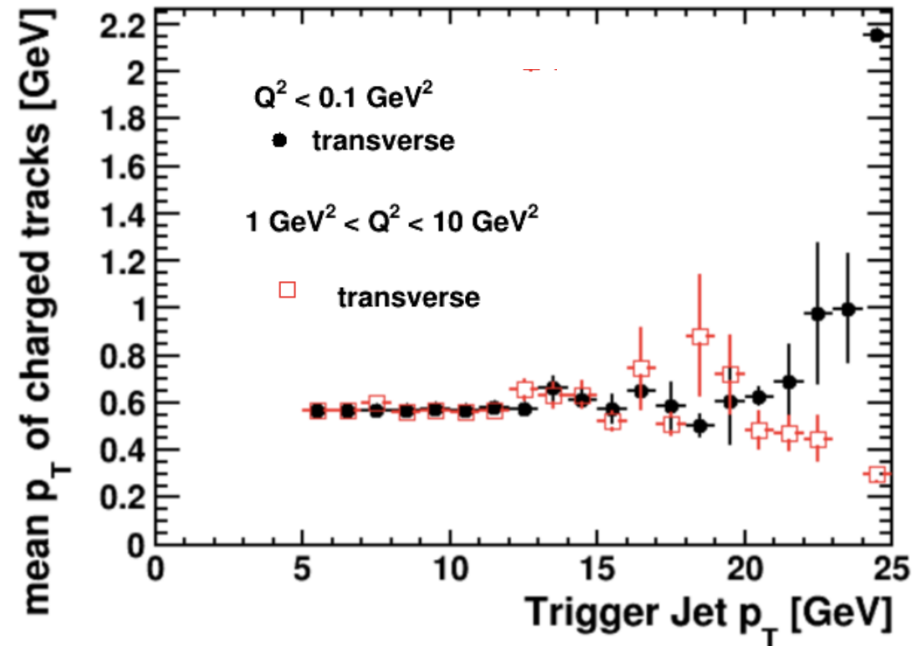

- Also plot the average summed particle p_T

- See little dependence on trigger jet p_T

- The number of charged particles and p_T sum in transverse region is small

Comparison with STAR

- See similar behavior in 200 GeV pp events at STAR
- Can we use STAR data to study certain EIC jet observables?

- Plot the average p_T for charged tracks as a function of trigger jet p_T
- See that these quantities are independent of the trigger jet p_T in transverse region as well as Q^2

arXiv:1107.4891

Jet Substructure: Angularity

- One goal of the EIC will be the exploration of cold nuclear matter, as well as the hadronization process, via electron-nucleus collisions
- Substructure observables quantify how energy is distributed within the jet – modification of substructure in eA may be sensitive to details of hadronization in nuclear matter and possibly to certain properties of the matter
- First step: explore behavior of substructure observables at EIC energies – focus on angularity

$$\tau_a \equiv \frac{1}{p_T} \sum_{i \in J} p_T^i (\Delta \mathcal{R}_{iJ})^{2-a}$$

Photoproduction Cross Section

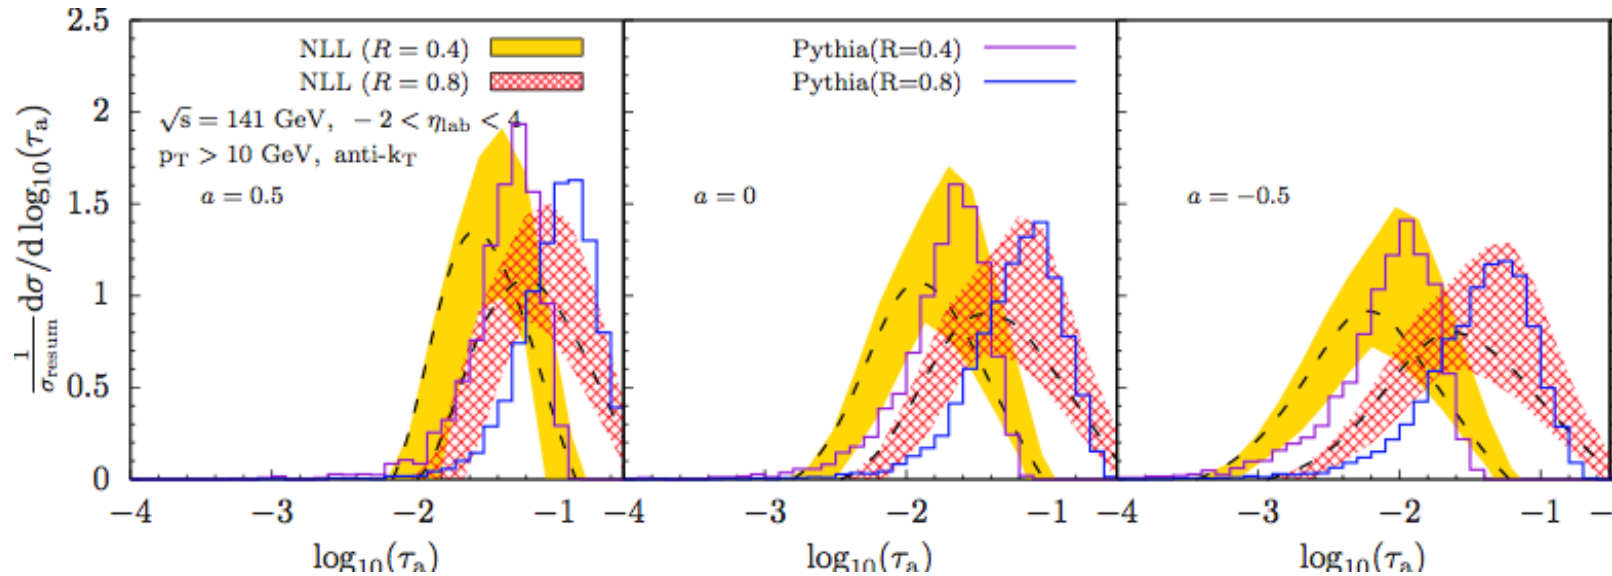

- Jet Radius = 0.8
- $0.2 < \text{inelasticity} < 0.8$
- Lab Frame
- Cross sections shown for jet $p_T > 4$ and jet $p_T > 10$ GeV

- Carry out angularity studies in photoproduction region ($10^{-5} < Q^2 < 1$)
- Resolved and direct cross sections from PYTHIA in good agreement with theoretical expectations (F. Ringer, K. Lee)

Angularity: Theory Vs PYTHIA

- Dotted curve represents theory result using natural scale choice
- Bands represent envelope when varying scales by factors of 2

Non-Perturbative Effects

Introduction

Inclusive Jets

Jet Substructure

Correlations

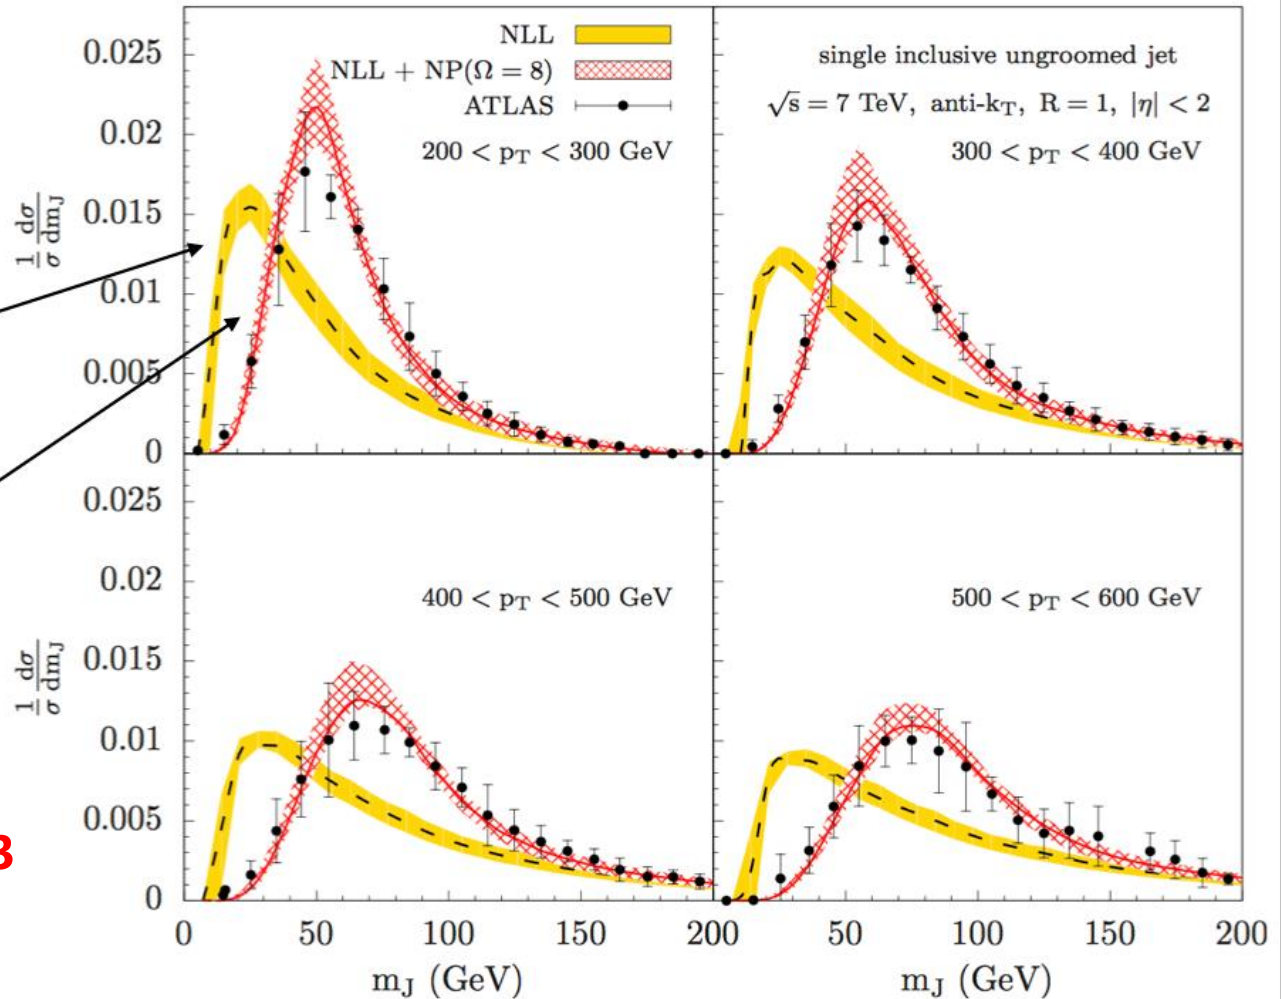

Conclusions

$$pp \rightarrow (\text{jet } m_J^2) X$$

Perturbative result

Including $d\sigma^{\text{pert}} \otimes F$
NP shape function

See F. Ringer's
Talk from Week 3

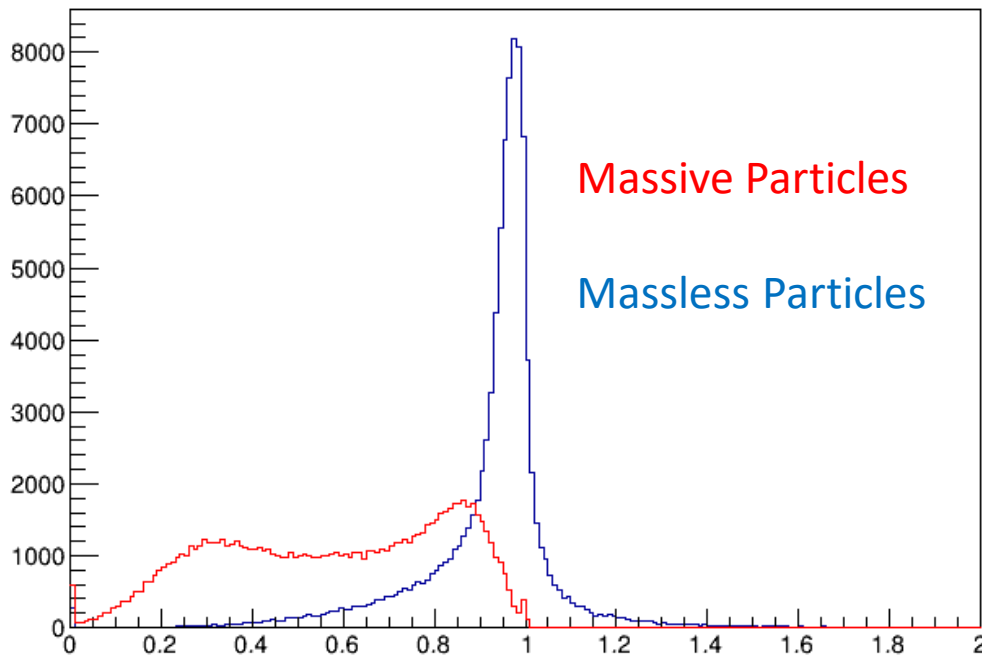

$$F_i(k) = \frac{4k}{\Omega^2} \exp(-2k/\Omega)$$

Relationship to Jet Mass

$$\tau_0 = \frac{m_J^2}{p_T^2} + \mathcal{O}(\tau_0^2)$$

$\tau_0 / (m^2/p_T^2)$

- Angularity with $a = 0$ is equal to the square of jet mass divided by the square of jet p_T (plus higher order terms)
- We find the validity of this relationship depends strongly on how the jet mass is constructed
- Adding full particle 4-vectors leads to discrepancy while good agreement seen for 'massless' particles
- Jet p_T s are small at an EIC, individual particle masses can be a non-negligible contribution
- Look at relationship for high p_T jets

Detector Considerations

Angularity Particle Effects

- In simulation, we can measure all particles exactly – what happens if some classes of particles are not measured or not measured well?
- Construct angularity excluding neutral hadrons (neutrons & K_L) and photons from pion decay
- Not measuring neutral hadrons results in a shift and slight shape change to angularity distribution
- Neglecting photons will significantly change distribution – electromagnetic calorimeter with good pointing resolution will be important

Power Corrections

$$\tau_a \equiv \frac{1}{p_T} \sum_{i \in J} p_T^i (\Delta \mathcal{R}_{iJ})^{2-a}$$

$$\tau_a^{e^+e^-} = \frac{1}{2E_J} \sum_{i \in J} |\vec{p}_T^{iJ}| \exp(-|\eta_{iJ}|(1-a))$$

$$\tau_a = \left(\frac{2E_J}{p_T} \right)^{2-a} \tau_a^{e^+e^-} + \mathcal{O}(\tau_a^2)$$

- In addition to that given above, can define angularity in terms of particle p_T and eta with respect to the jet thrust axis – call this $\tau_a^{e^+e^-}$
- The original angularity is equal to $\tau_a^{e^+e^-}$ times a prefactor plus power corrections
- Can explore the behavior of these higher order terms by taking a ratio of $\tau_a^{e^+e^-}$ to the original definition

Power Corrections: Compare 'a'

R = 0.4

R = 0.8

$p_T > 5.0$

Angularity e^+e^- Over Tau (Massless Particles): R=0.4 $p_T > 5.0$

Angularity e^+e^- Over Tau (Massless Particles): R=0.8 $p_T > 5.0$

$p_T > 10.0$

Angularity e^+e^- Over Tau (Massless Particles): R=0.4 $p_T > 10.0$

Angularity e^+e^- Over Tau (Massless Particles): R=0.8 $p_T > 10.0$

Power Corrections: Compare p_T

R = 0.4

R = 0.8

a = -2.0

e^+e^-/Tau p_T Comparison: R=0.4, a=-2.0

e^+e^-/Tau p_T Comparison: R=0.8, a=-2.0

a = 1.0

e^+e^-/Tau p_T Comparison: R=0.4, a=1.0

e^+e^-/Tau p_T Comparison: R=0.8, a=1.0

Power Corrections: Compare R

$a = -2.0$

$a = 1.0$

$p_T > 5.0$

e^+e^-/Tau Radius Comparison: $p_T > 5, a = -2.0$

e^+e^-/Tau Radius Comparison: $p_T > 5, a = 1.0$

e^+e^-/Tau Radius Comparison: $p_T > 10, a = -2.0$

e^+e^-/Tau Radius Comparison: $p_T > 10, a = 1.0$

$p_T > 10.0$

Power Corrections: Compare R

$a = -2.0$

$a = 1.0$

$p_T > 5.0$

e^+e^-/Tau Radius Comparison: $p_T > 5, a = -2.0$

e^+e^-/Tau Radius Comparison: $p_T > 5, a = 1.0$

- For a given radius and transverse momentum, higher order corrections become more prominent as 'a' decreases

- Smaller 'a' place more weight on energy far from the thrust axis

- For smallest 'a' and largest radii, increasing p_T reduces higher order corrections modestly

- Using a smaller radius reduces higher order terms noticeably for the smallest 'a' values where these terms are largest

$p_T > 10.0$

e^+e^-/Tau Radius Comparison: $p_T > 10, a = -2.0$

Quark / Gluon Discrimination

- Ultimately want to see if angularities could be useful in exploring properties of cold nuclear matter
- Simulate the formation of jets in a medium and then vary parameters of interest and see how the energy distribution within a jet changes using angularity
- Not there yet
- Look at quark vs gluon jet discrimination to get a feeling for how sensitive angularities are to different energy distributions within a jet (gluon jets should be 'fatter' on average)

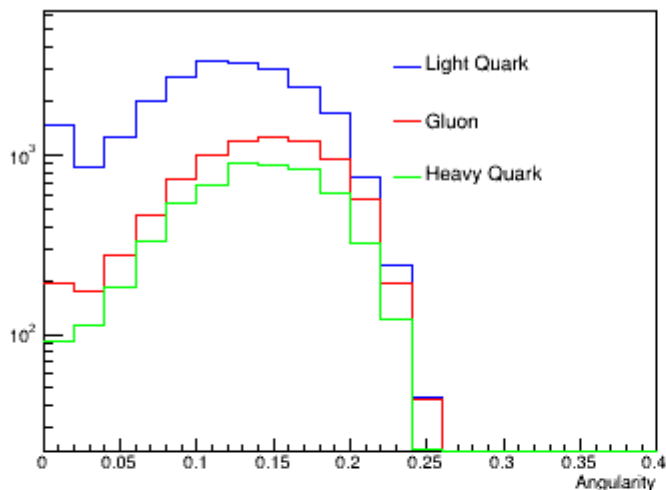

Quark Vs Gluon 'a' = 1.0

R = 0.4

R = 0.8

$p_T > 5.0$

Angularity: R = 0.4: $p_T > 5.0$: a = 1.0

Angularity: R = 0.8: $p_T > 5.0$: a = 1.0

Angularity: R = 0.4: $p_T > 10.0$: a = 1.0

Angularity: R = 0.8: $p_T > 10.0$: a = 1.0

$p_T > 10.0$

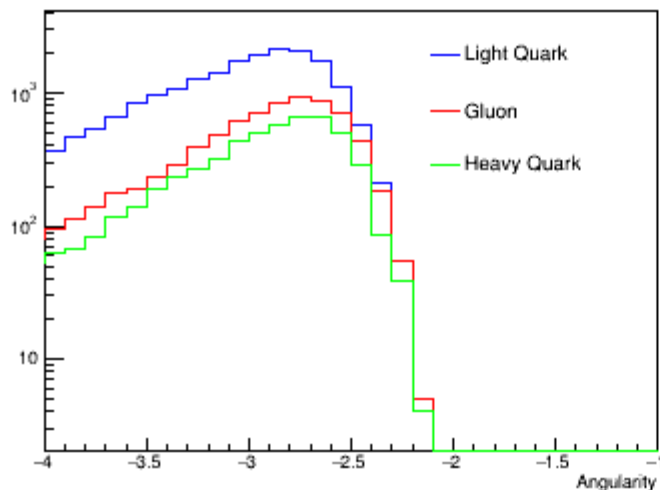

Quark Vs Gluon 'a' = -2.0

R = 0.4

R = 0.8

$p_T > 5.0$

Log Angularity: R = 0.4: $p_T > 5.0$: a = -2.0

Log Angularity: R = 0.8: $p_T > 5.0$: a = -2.0

Log Angularity: R = 0.4: $p_T > 10.0$: a = -2.0

Log Angularity: R = 0.8: $p_T > 10.0$: a = -2.0

$p_T > 10.0$

Quark Vs Gluon 'a' = -2.0

R = 0.4

R = 0.8

$p_T > 5.0$

Log Angularity: R = 0.4: $p_T > 5.0$: a = -2.0

Log Angularity: R = 0.8: $p_T > 5.0$: a = -2.0

- See decent separation between light quark and gluon jets for R = 0.8 and full range of 'a' values

- Poor separation at R = 0.4 may be due to selection bias – Smaller radius will select those gluon jets which happen to have a narrower fragmentation and thus look more like quark jets

$p_T > 10.0$

Log Angularity: R = 0.4: $p_T > 10.0$: a = -2.0

- Nevertheless, may want to use larger radii when looking at medium effects, especially as eA collisions should have less underlying event contaminating the jet

Conclusions

- General jet properties were presented and it is seen that high energies will be important for gathering statistics and extending kinematic reach
- Angularities were investigated in Monte Carlo and found to be in good agreement with theory
- Method for exploring the impact of higher order corrections was presented
- Angularity observable shows sensitivity to energy distribution in jet arising from different fragmentation of quarks vs gluons
- Next steps:
 - Simulate at expected eA energies
 - Implement realistic nuclear matter effects
 - Possibly look at grooming
 - Look into different recombination schemes (winner-take-all) which are not sensitive to soft recoils

Backup

Relevant Scales

$$\frac{d\sigma}{d\eta dp_T d\tau} = \sum_{abc} f_a(x_a, \mu) \otimes f_b(x_b, \mu) \otimes H_{ab}^c(x_a, x_b, \eta, p_T/z, \mu) \otimes \mathcal{G}_c(z, p_T, R, \tau, \mu)$$

$$\mathcal{G}_c(z, p_T, R, \tau, \mu) = \sum_i \mathcal{H}_{c \rightarrow i}(z, p_T R, \mu) C_i(\tau, p_T, \mu) \otimes S_i(\tau, p_T, R, \mu)$$

Talk from Week 3

Detector Overview (BNL)

Jet p_T Reconstruction: HCal Options

Comparing Resolutions

Particle Level Spectrum: Smeared Jet Pt = 7 GeV

Particle Level Spectrum: Smeared Jet Pt = 10 GeV

Particle Level Spectrum: Smeared Jet Pt = 13 GeV

- Show particle level jet p_T spectrum for 3 specific reconstructed jet p_T values
- No mid-rapidity HCal
- Lo Res mid-rapidity HCal
- Hi Res mid-rapidity HCal

Neutral Hadron Veto

- Can use lo res HCal to select jets which contain a neutral hadron
- This subsample can be unfolded while leaving the larger jet sample which do not contain a neutral hadron alone
