

# Lecture 3: Properties of Superheavy Elements

## Searching for New Elements

# Chart of the Nuclides: 2019

## Superheavy Elements:

- Production rates = atoms/s to atoms/month
- Lifetimes = seconds to microseconds

# Unique Challenges With Transactinide Experiments

## Challenges with heavy element chemistry:

- Only make one atom-at-a-time
- Atoms formed with the momentum of the beam → 36000 m/s
- Transactinides are short-lived with lifetimes of minutes or less

# What we can learn from decays of just a few atoms?

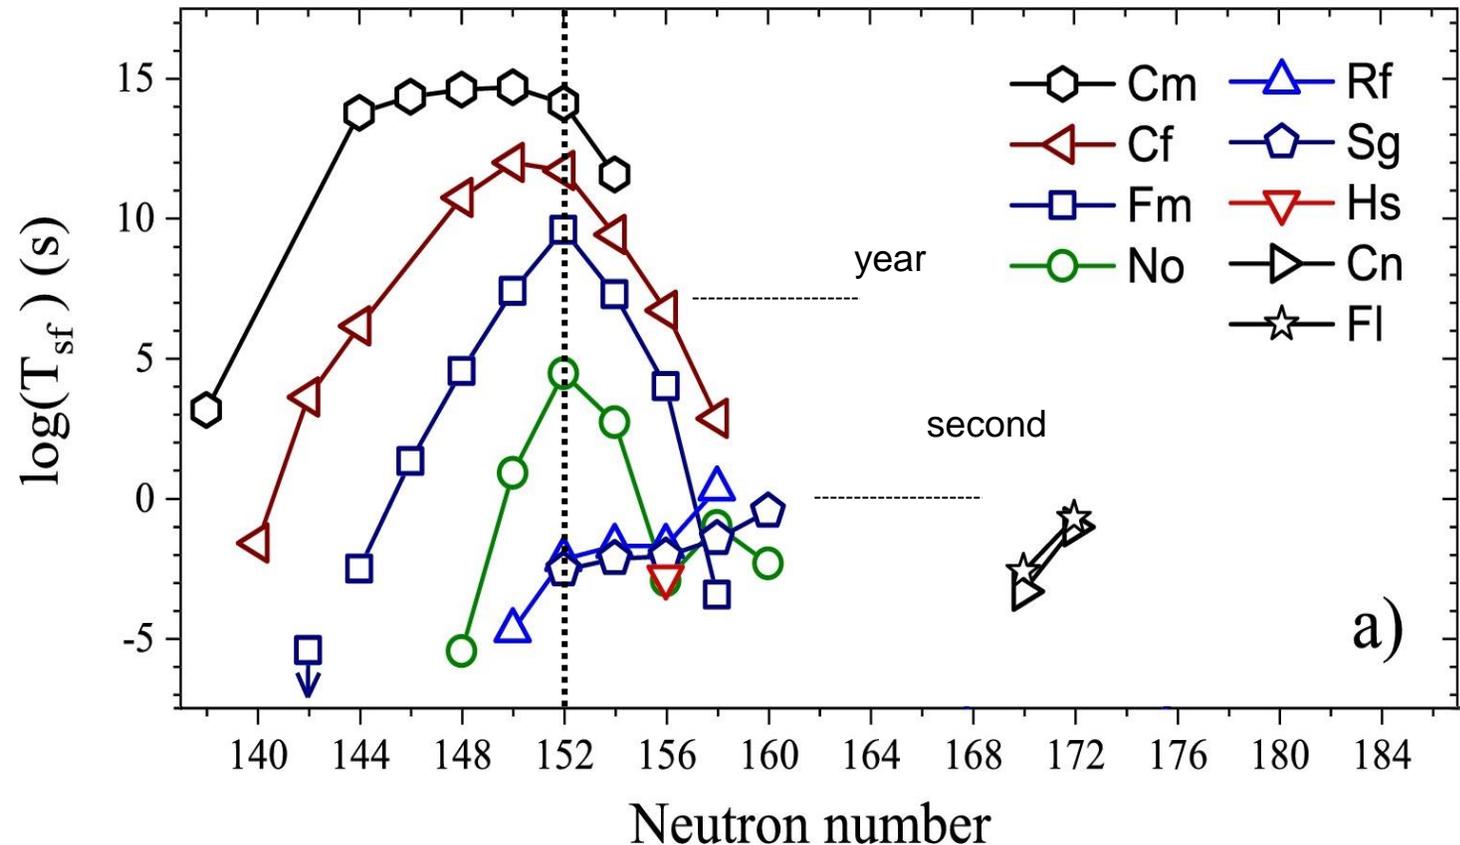

## Can measure

- Decay mode
- Decay energy
- Decay lifetime
- Photons emitted during de-excitation
- (Some) chemistry
- High precision mass measurements ( $Z \leq 104$ )
- Energies of atomic levels ( $Z \leq 102$ )

# Fission

# Spontaneous Fission Lifetimes

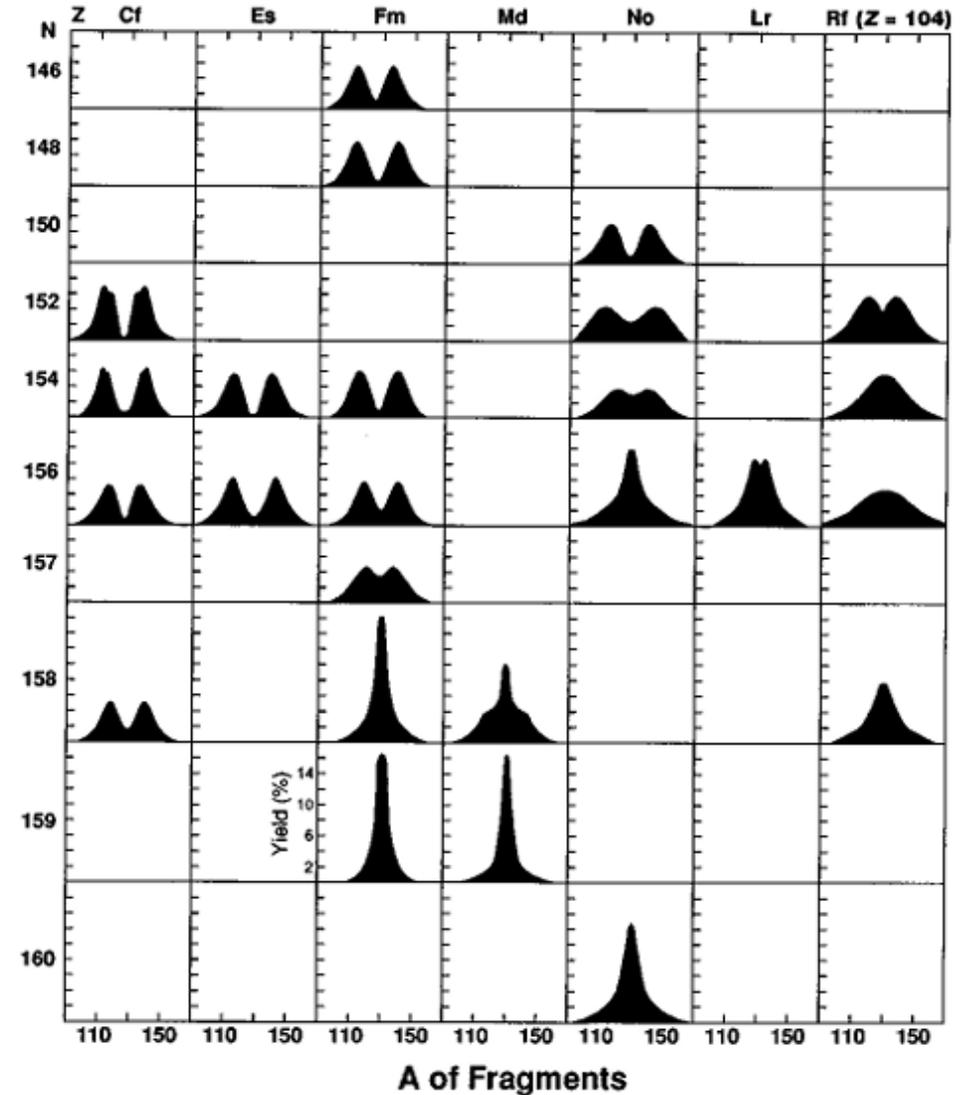

- Plot of spontaneous fission partial half-lives for known fission emitters
- Strong  $N=152$  shell in lighter isotopes

Khuyagbaatar, J.: Nucl. Phys. A **1002** (2020) 121958: <https://doi.org/10.1016/j.nuclphysa.2020.121958>

# Fission Fragment Masses

Can observe the evolution of fragment mass yields for actinide and transactinide isotopes

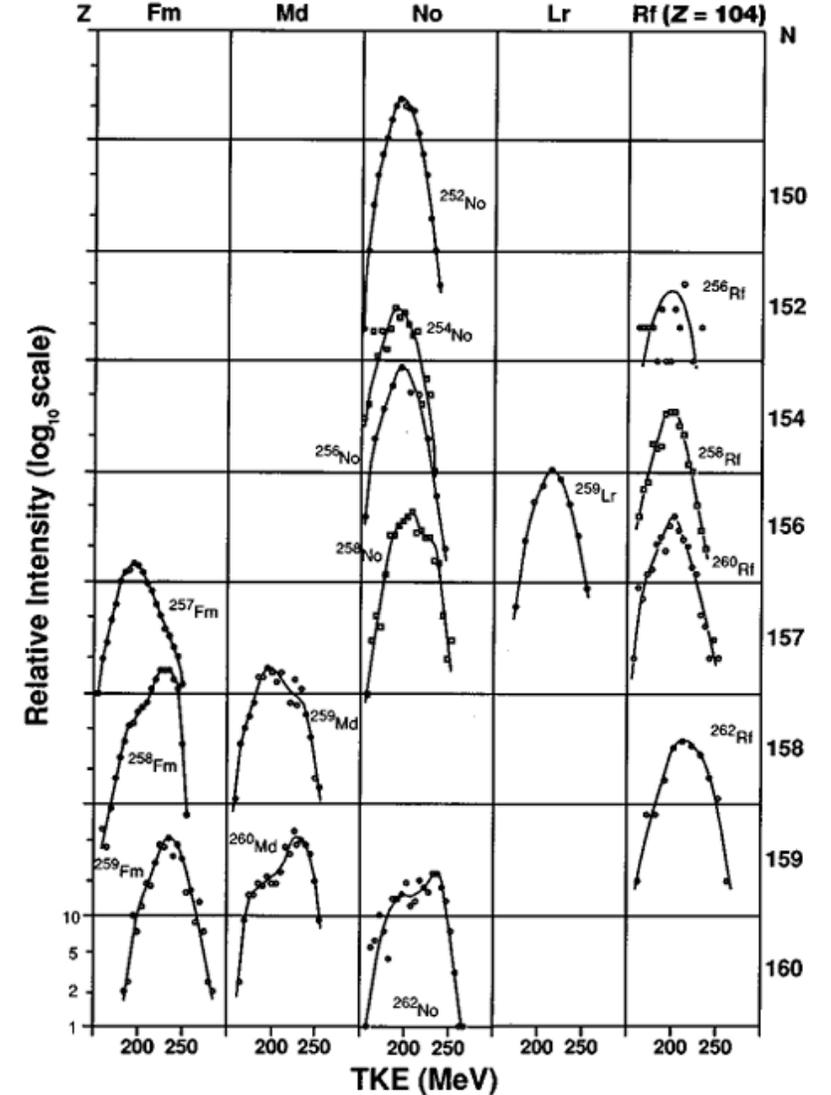

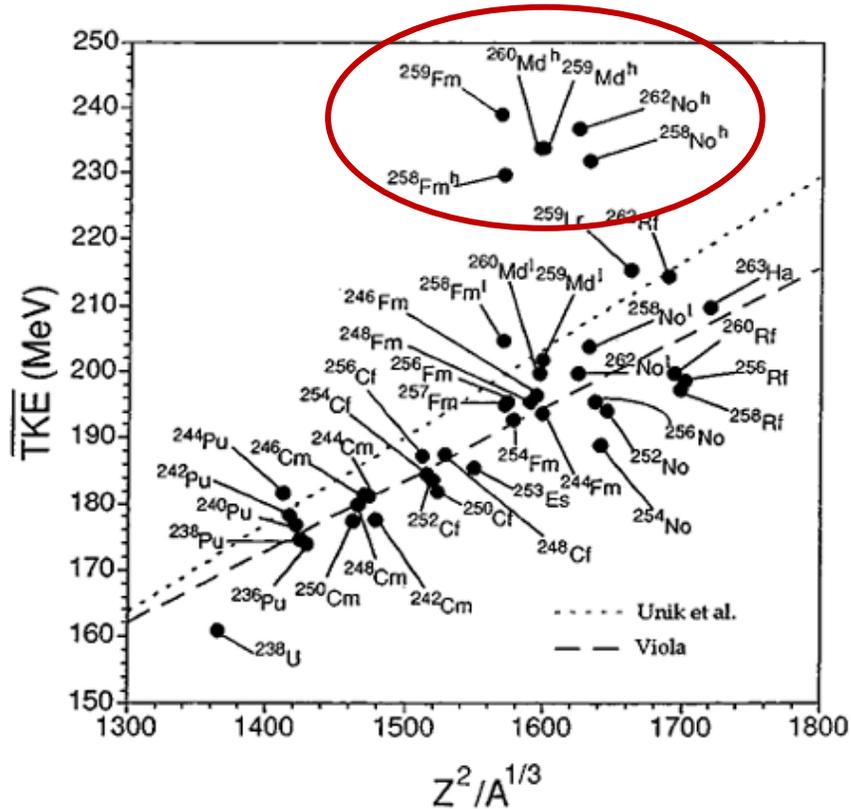

Lane, M.R. Phys. Rev. C **53** (1996) 2893: <https://doi.org/10.1103/PhysRevC.53.2893>

# Total Kinetic Energy

TKE Distributions for actinide and transactinide nuclides

Symmetric fission

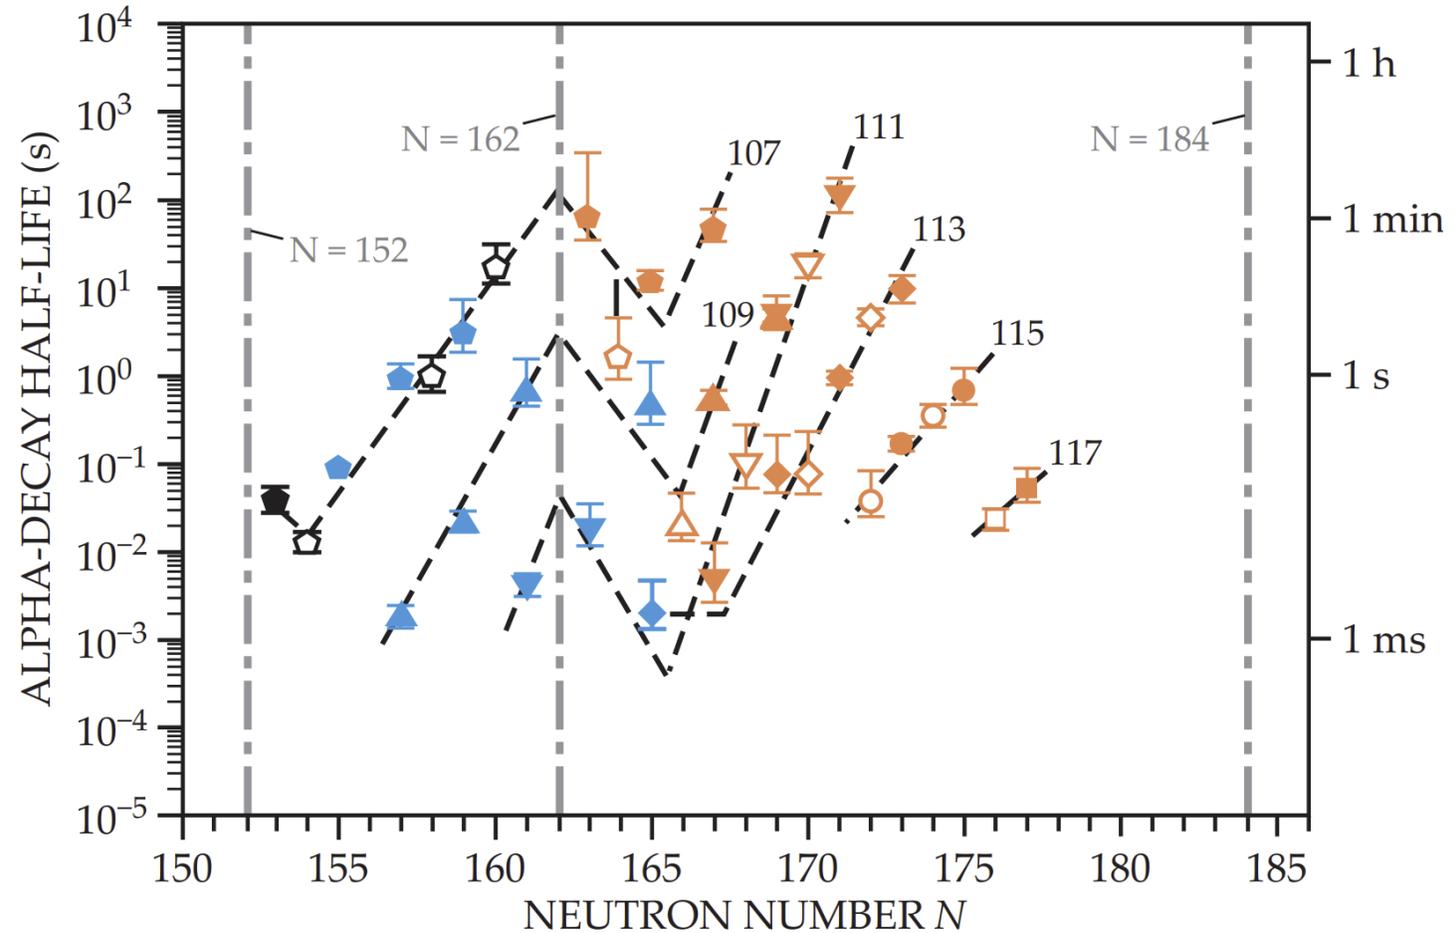

Lane, M.R. Phys. Rev. C **53** (1996) 2893: <https://doi.org/10.1103/PhysRevC.53.2893>

# Alpha Decay

# Alpha Decay Half-life

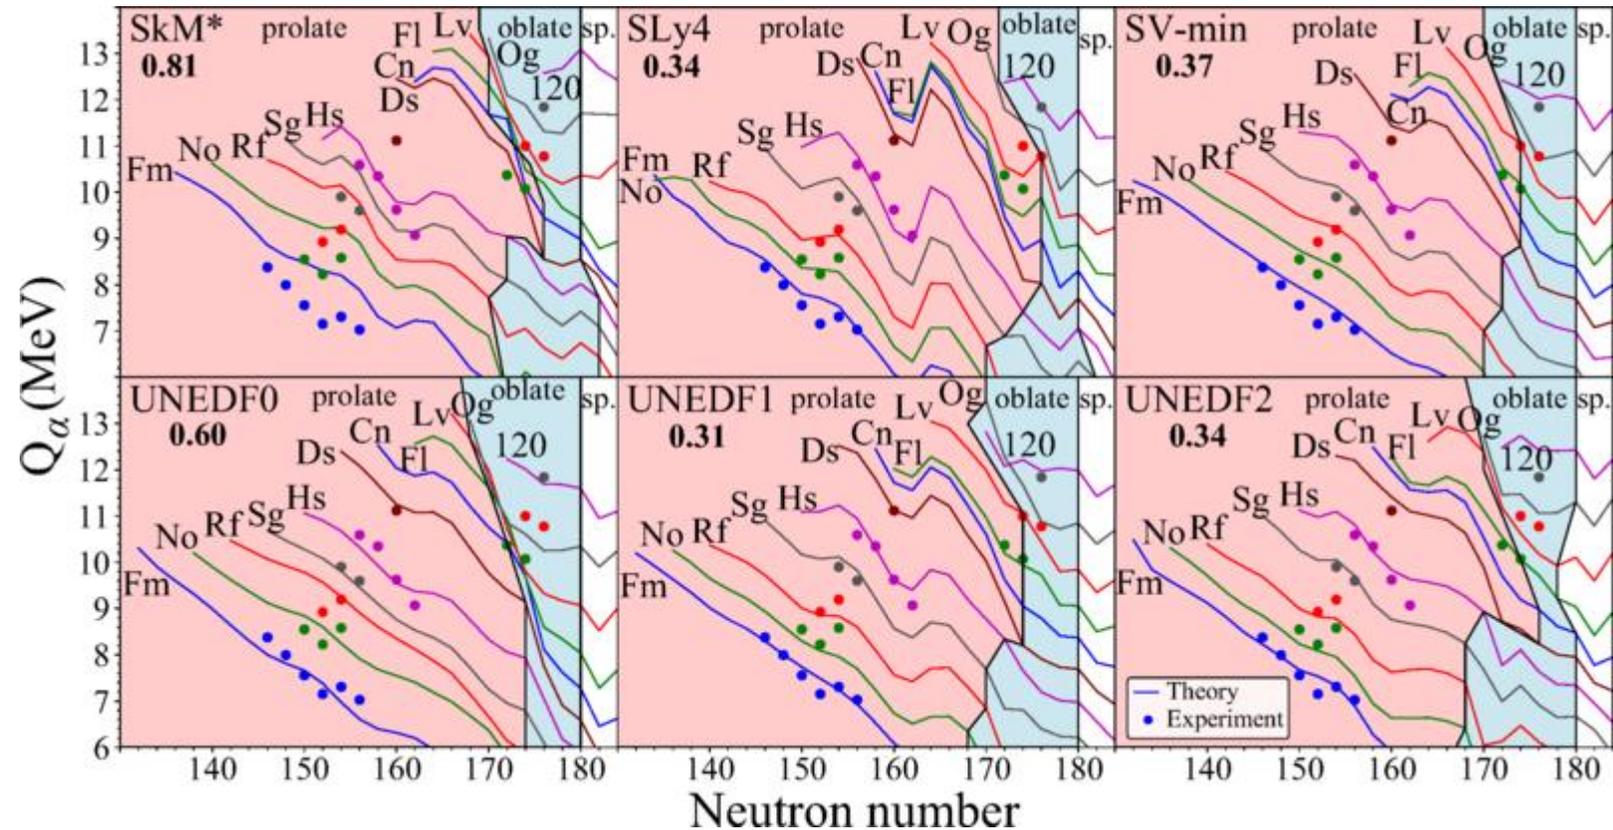

Can measure alpha decay energies and half-lives for all isotopes observed to decay via alpha

Oganessian, Yu.Ts., Phys. Today **68** (2015) 32: <https://doi.org/10.1063/PT.3.2880>

# Alpha energy systematics

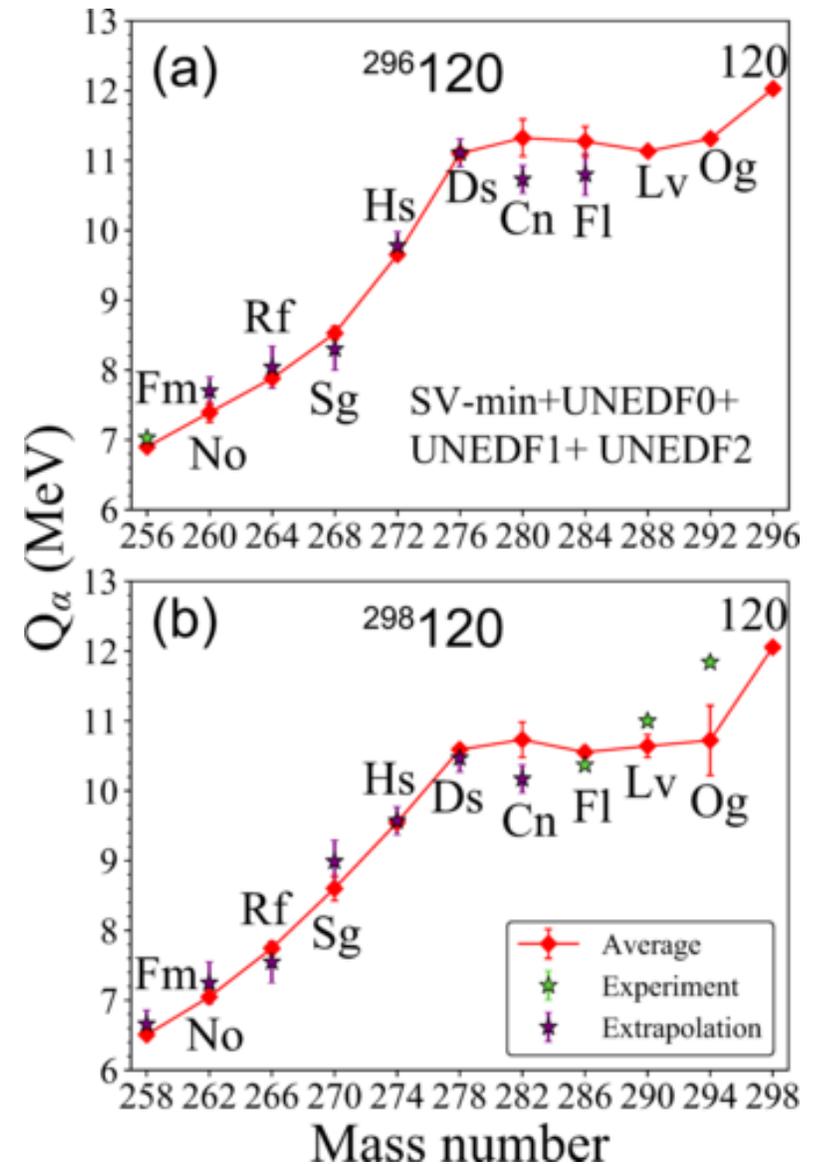

Can use known alpha decay energies to hone theories of nuclear structure

Olsen, E., Phys. Rev. C **99** (2019) 014317: <https://doi.org/10.1103/PhysRevC.99.014317>

# Alpha decay

Honing theories allows us to look and identify new isotopes through observations of isotopic chains and comparisons to theory

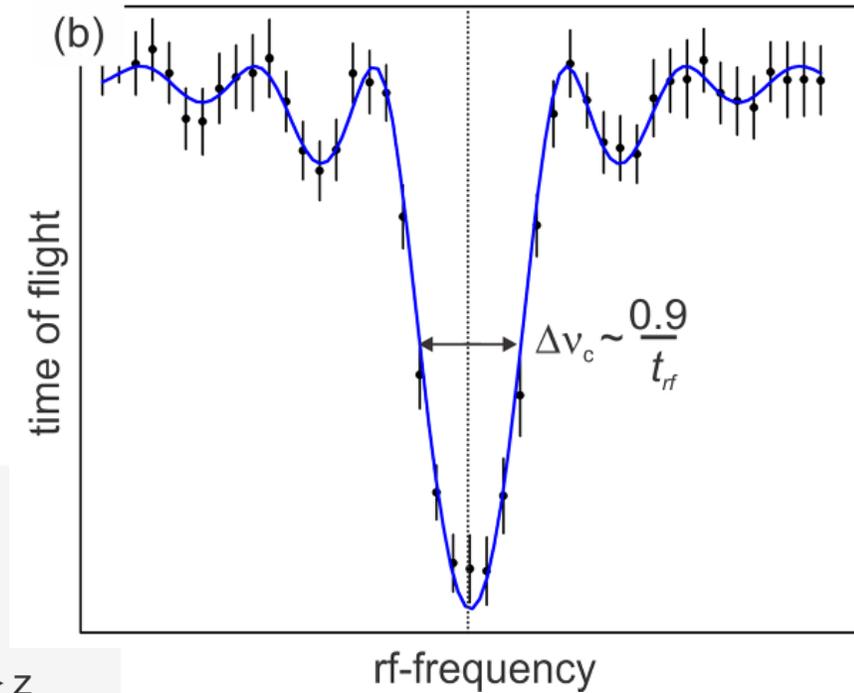

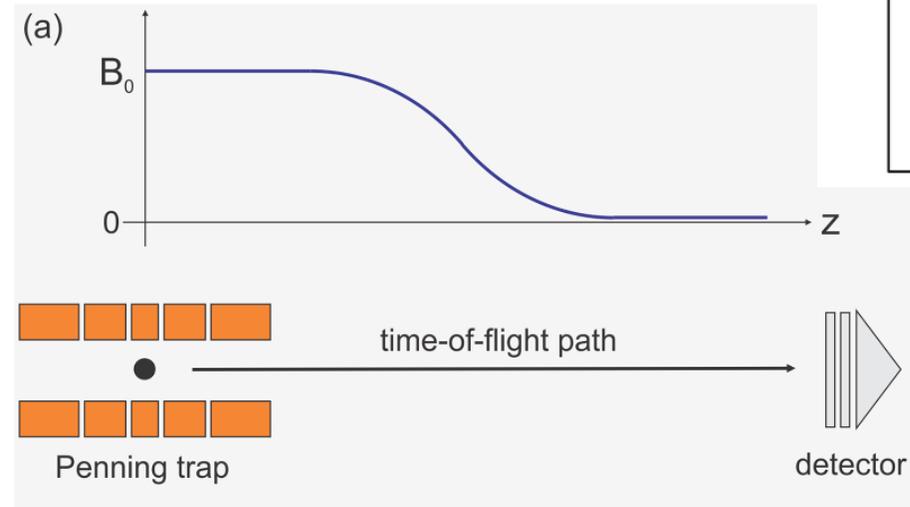

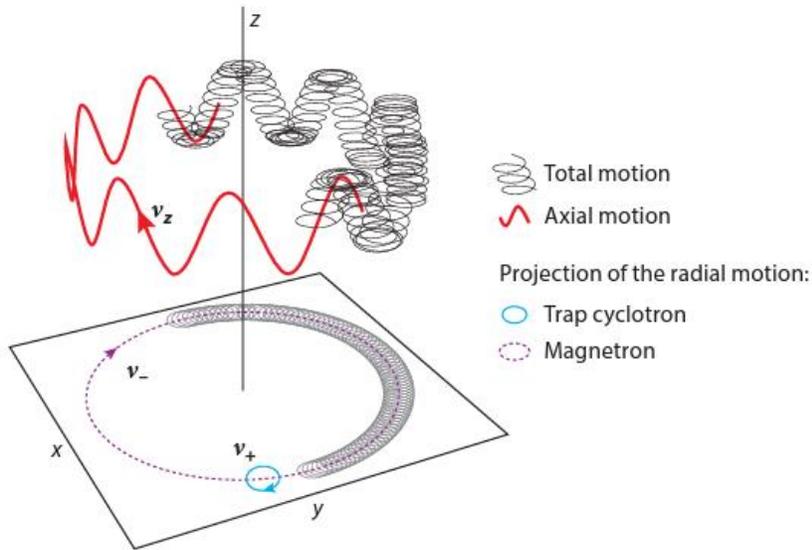

Olsen, E., Phys. Rev. C **99** (2019) 014317: <https://doi.org/10.1103/PhysRevC.99.014317>

# Atomic Masses

# Atomic Masses – Penning Trap

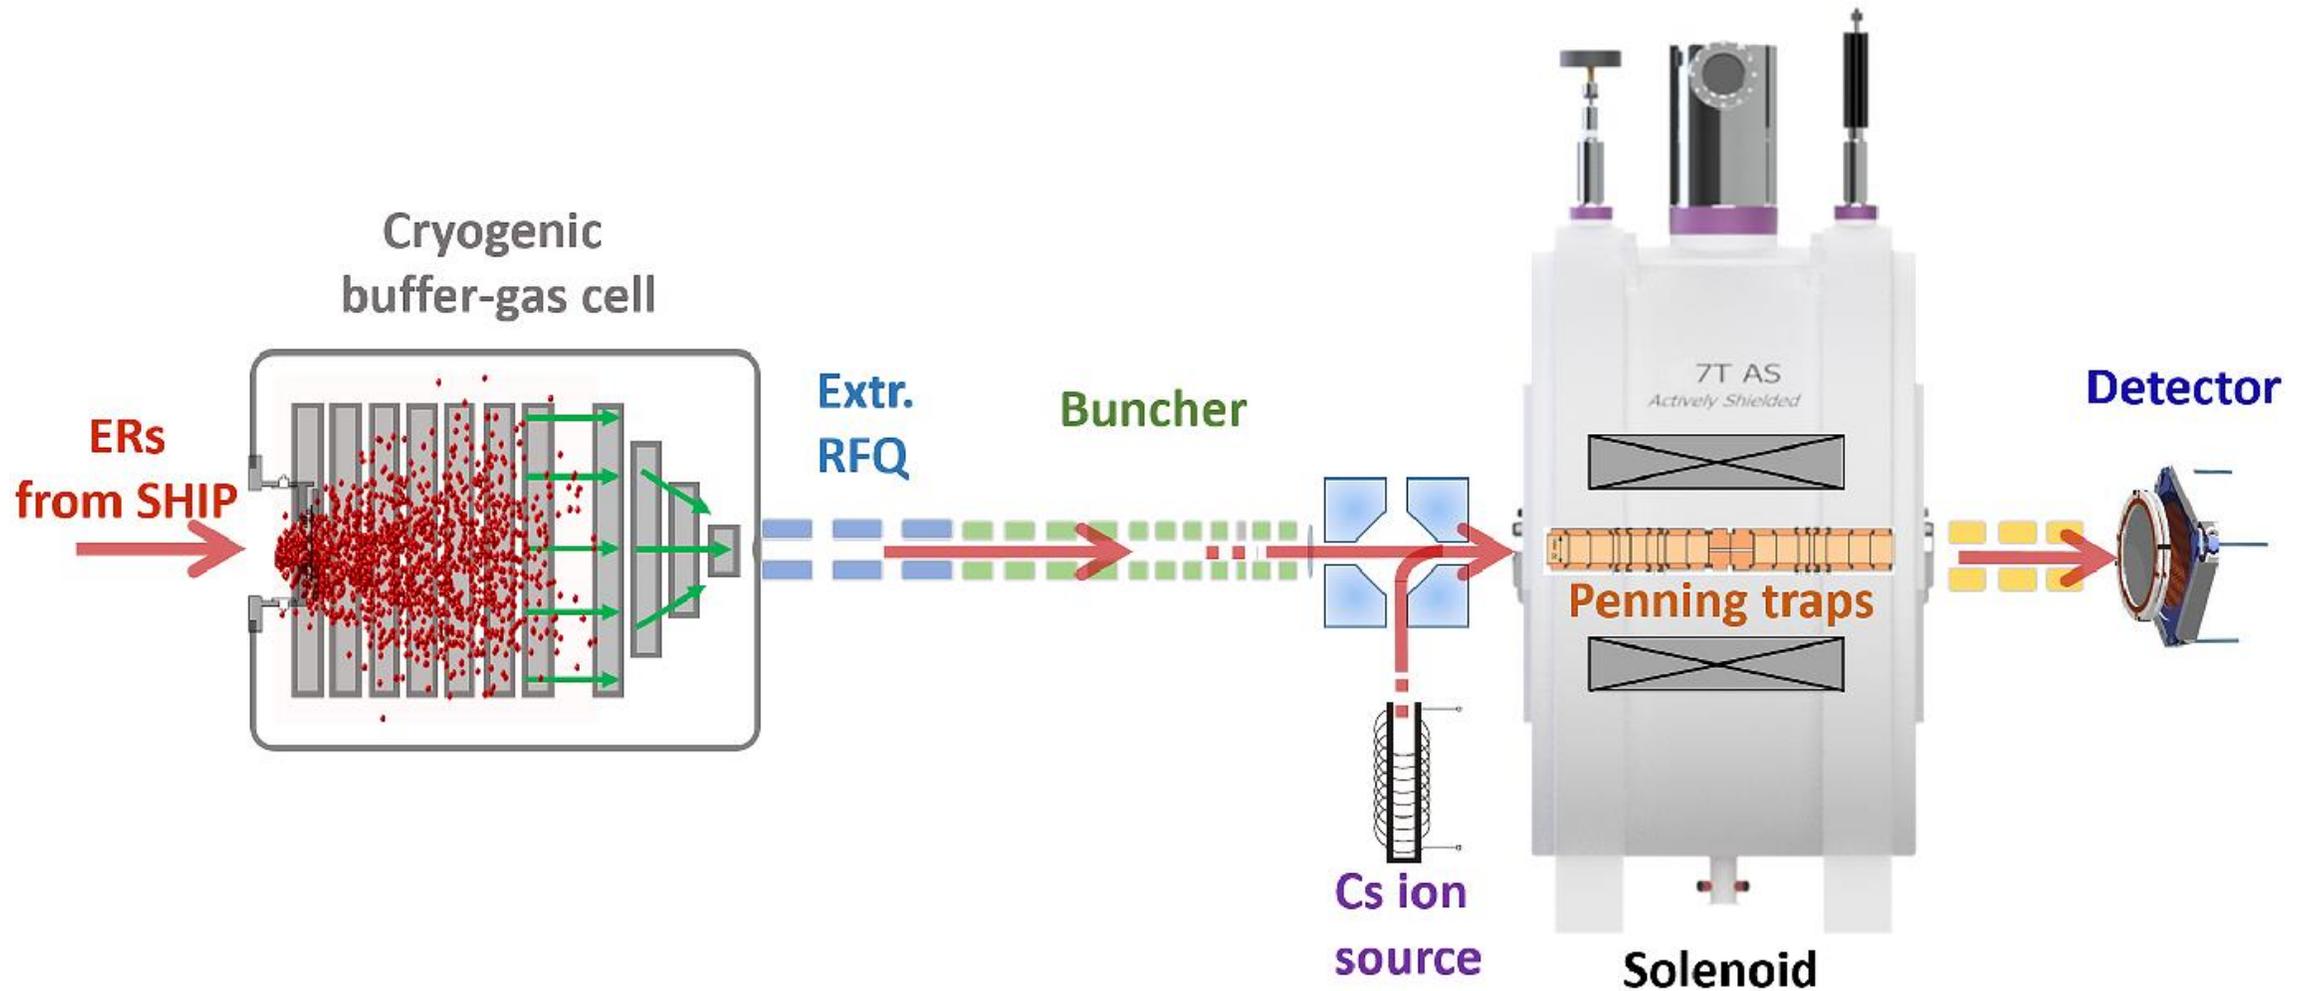

**Trap ion in:** Superposition of a static strong uniform magnetic field ( $B$ ) and a static three-dimensional quadrupole electric potential

Eliseev, S., Euro. Phys. J. A, **59** (2023) 34: <https://doi.org/10.1140/epja/s10050-023-00946-4>

Dilling, J, Annul. Rev. Nucl. Part. Sci. **68** (2018) 45: <https://doi.org/10.1146/annurev-nucl-102711-094939>

# Atomic Masses – Penning Trap

Block, M., Nucl. Phys. A, **944** (2015) 471: <https://doi.org/10.1016/j.nuclphysa.2015.09.009>

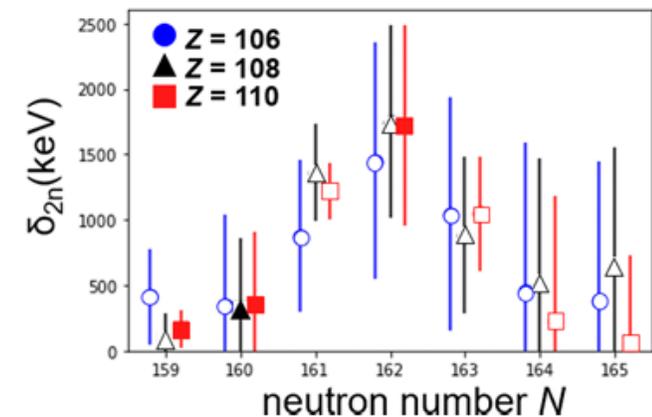

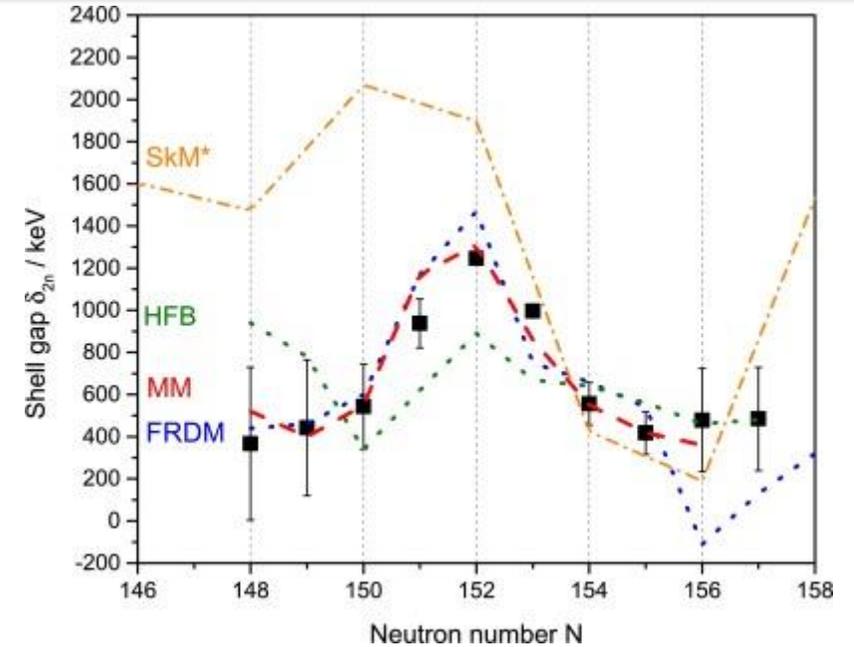

Block, M. La Rivista del Nuovo Cimento **45** (2022) 279: <https://doi.org/10.1007/s40766-022-00030-5>

# Atomic Masses – Penning Traps

Precise masses can be used to access evolution of neutron shell gaps at  $N=152$  and  $N=162$

Newer techniques such as PI-ICR can identify energies of isomeric states

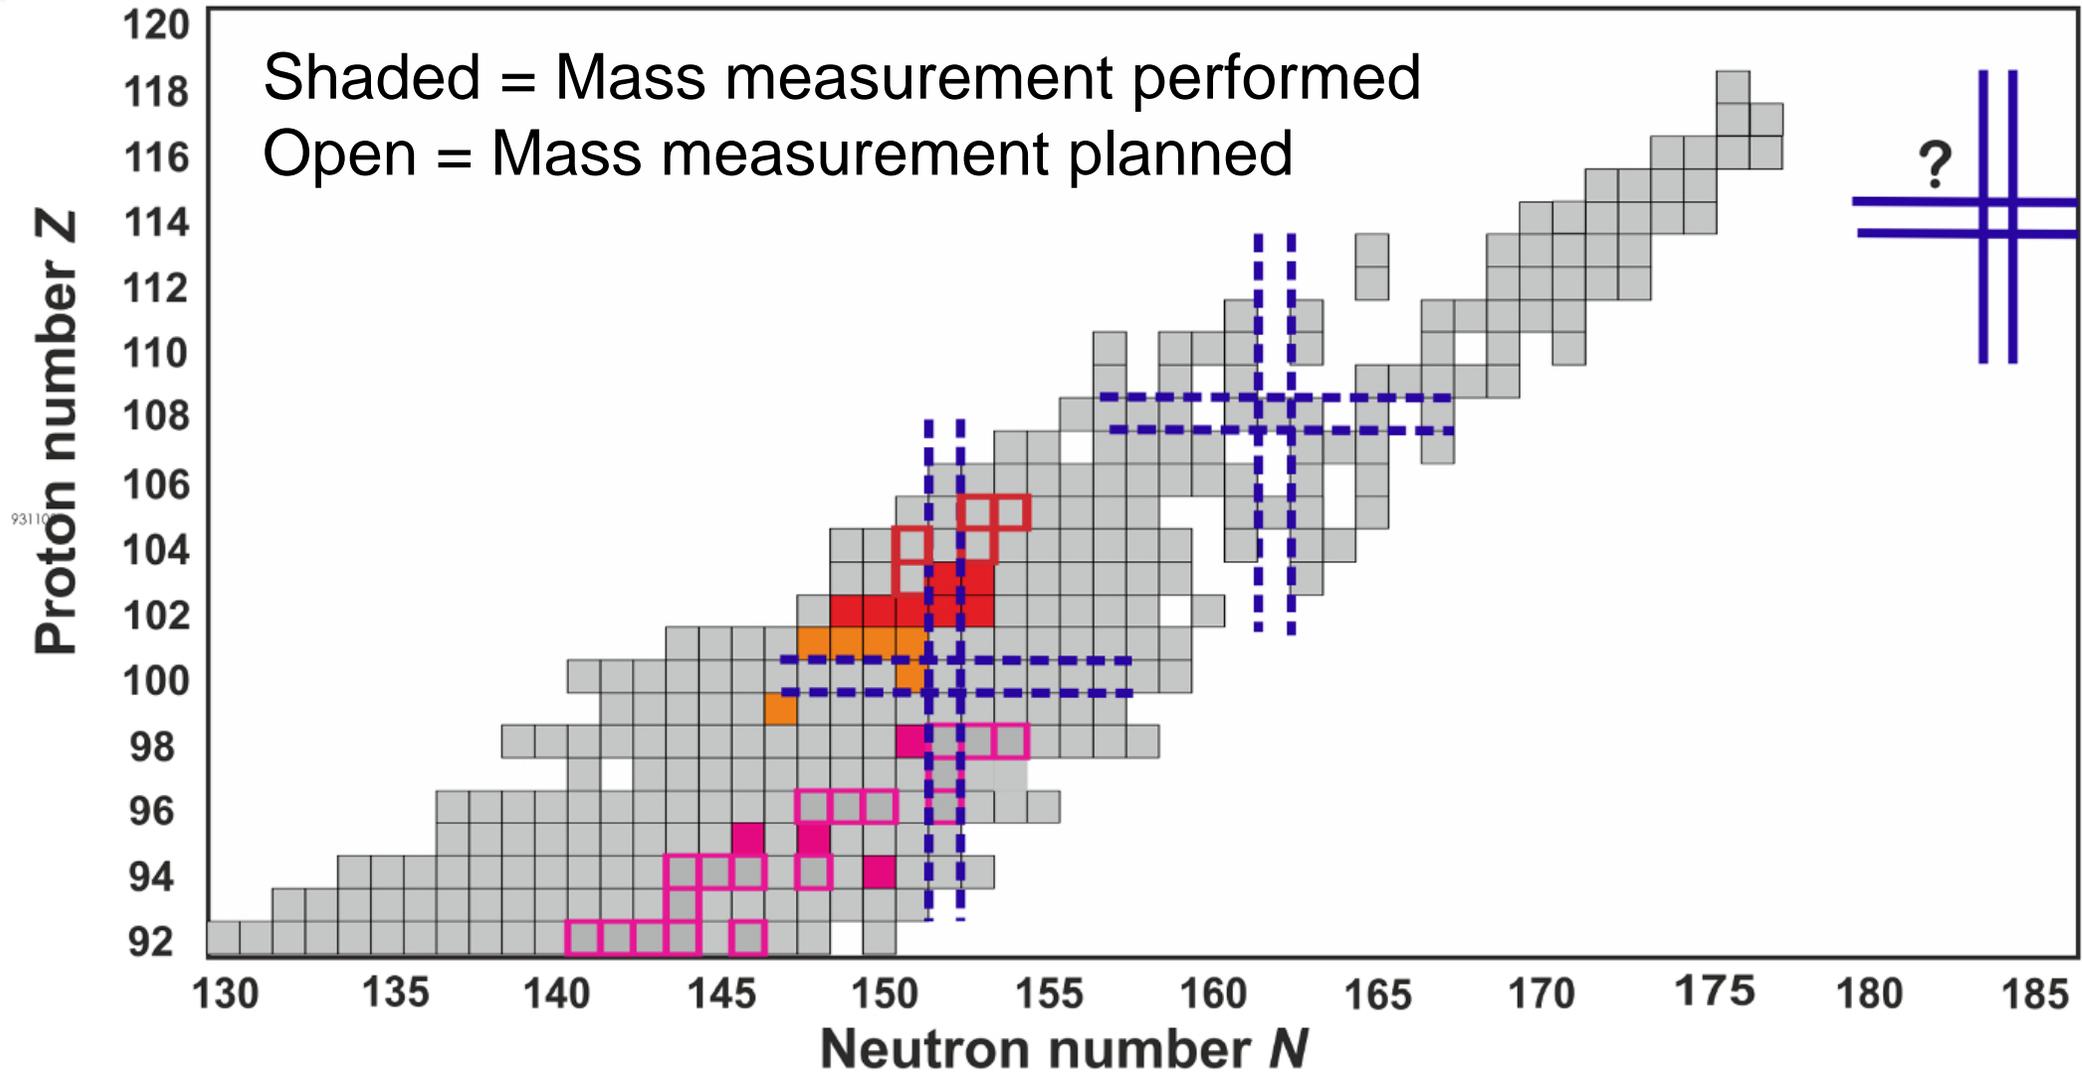

Downside: Lots of ions required to make measurements → limit to how high in  $Z$  measurements can go

Block, M., Nucl. Phys. A, **944** (2015) 471: <https://doi.org/10.1016/j.nuclphysa.2015.09.009>

Block, M. La Rivista del Nuovo Cimento **45** (2022) 279: <https://doi.org/10.1007/s40766-022-00030-5>

# Atomic Masses – Penning Trap

Block, M., Nucl. Phys. A, **944** (2015) 471: <https://doi.org/10.1016/j.nuclphysa.2015.09.009>

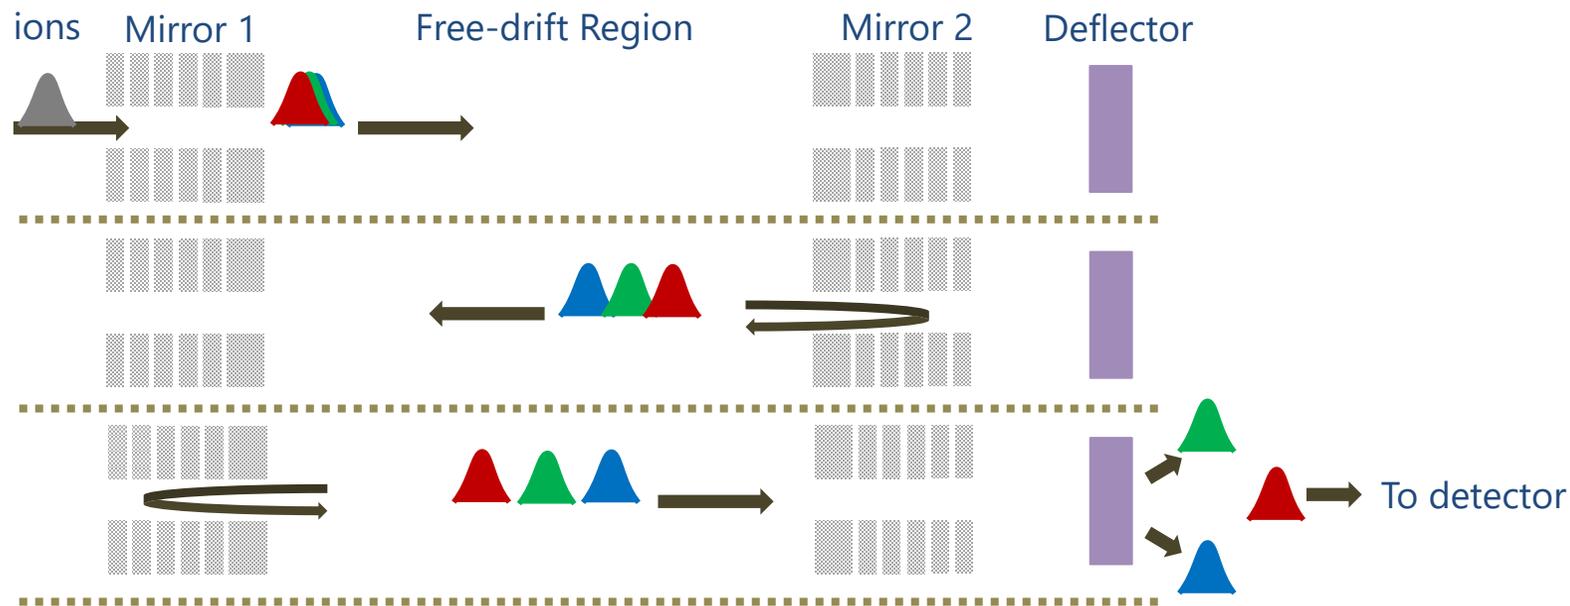

Block, M. La Rivista del Nuovo Cimento **45** (2022) 279: <https://doi.org/10.1007/s40766-022-00030-5>

**Question:** can we obtain high-resolution mass measurements with fewer atoms?

# Atomic Masses – MR-TOF

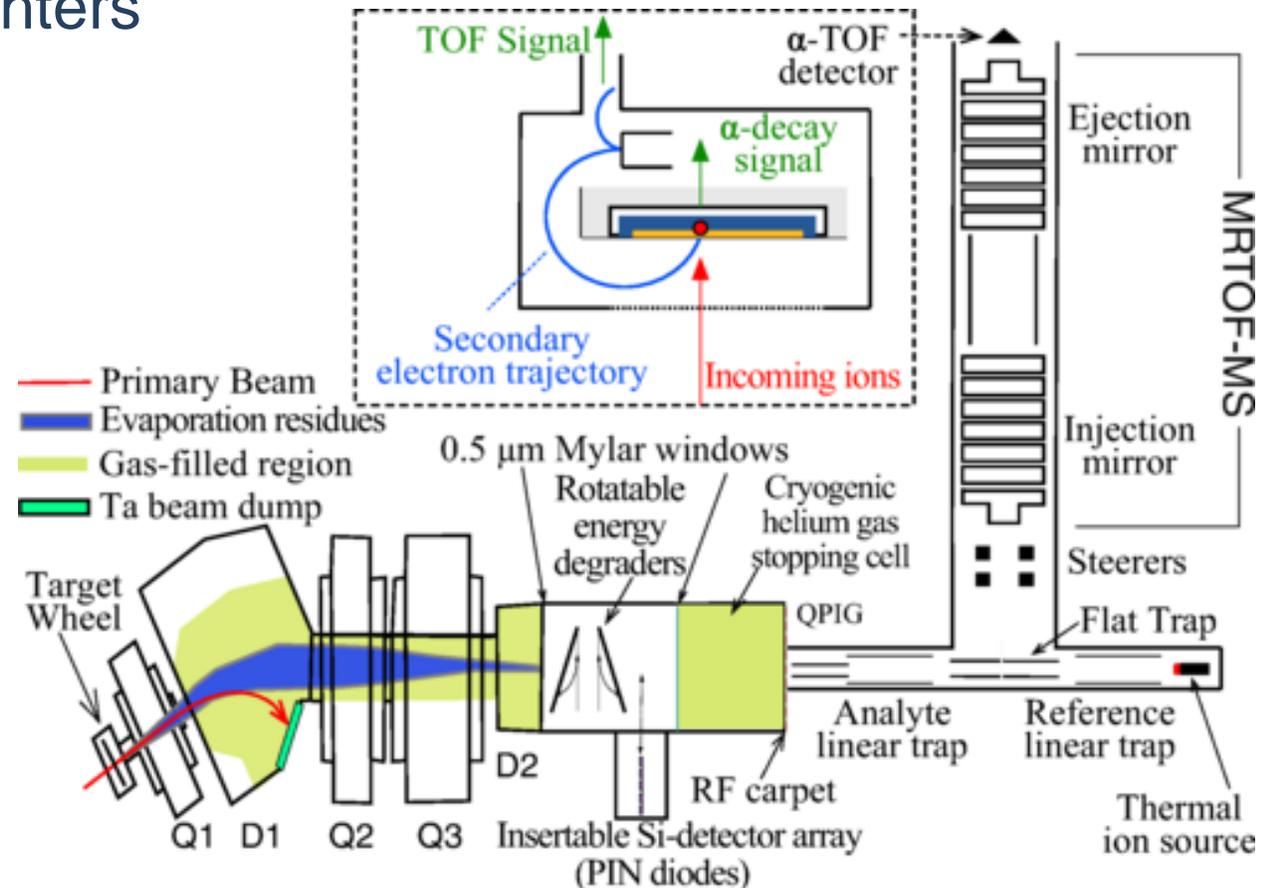

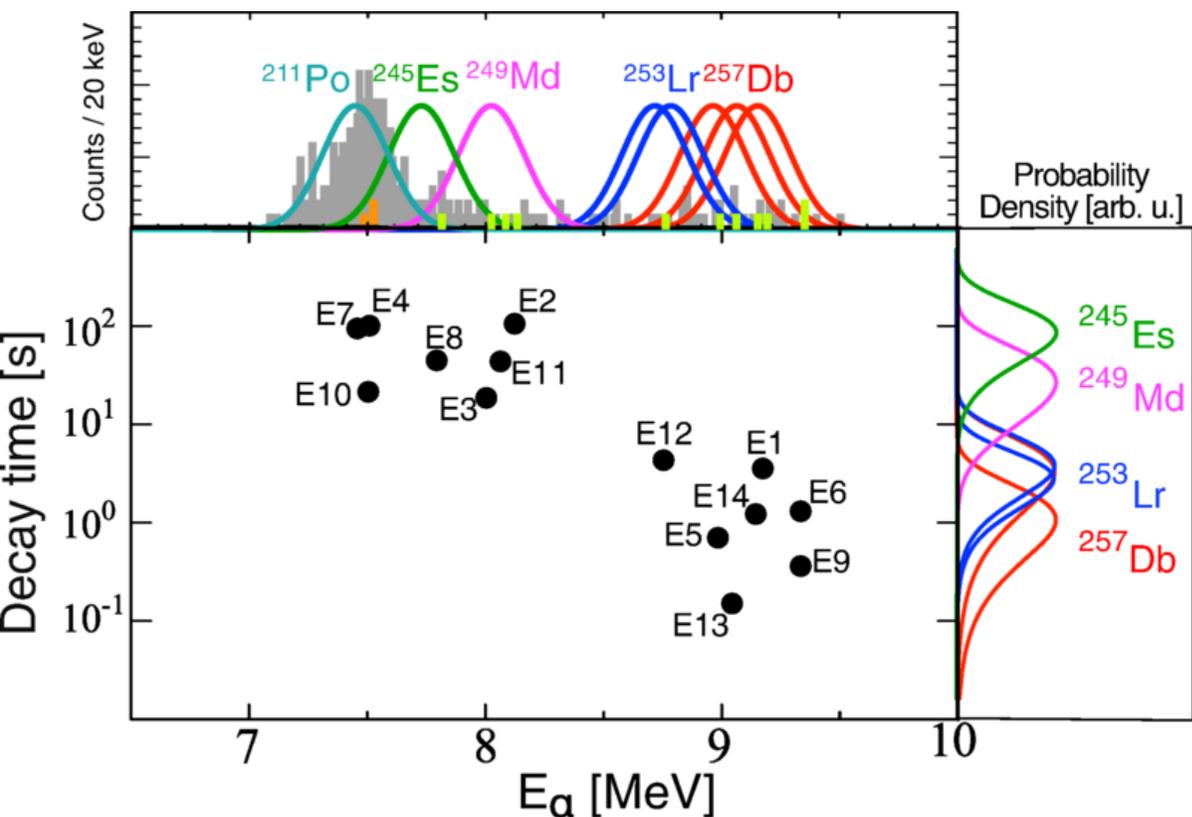

## Multi-Reflection Time-of-Flight (MR-TOF)

- Accelerate ions across a known voltage gap
- Trap ion between two electrostatic mirrors
- Ions separate during flight path according differing  $A/q$

# Atomic Masses – MR-TOF

Observed time-of-flight and alpha decay energy for 11 events attributed to  $^{257}\text{Db}$  and its daughters

Schury, P. Phys. Rev. C **104** (2021) L021304: <https://doi.org/10.1103/PhysRevC.104.L021304>

# In-Beam Spectroscopy

# In-beam Spectroscopy

Probe highly excited nuclear levels populated during de-excitation of a nucleus

Step 1: Surround target with lots of germanium

Step 2: Make SHE in nuclear reaction

Step 3: Observe gamma rays emitted during deexcitation of SHE

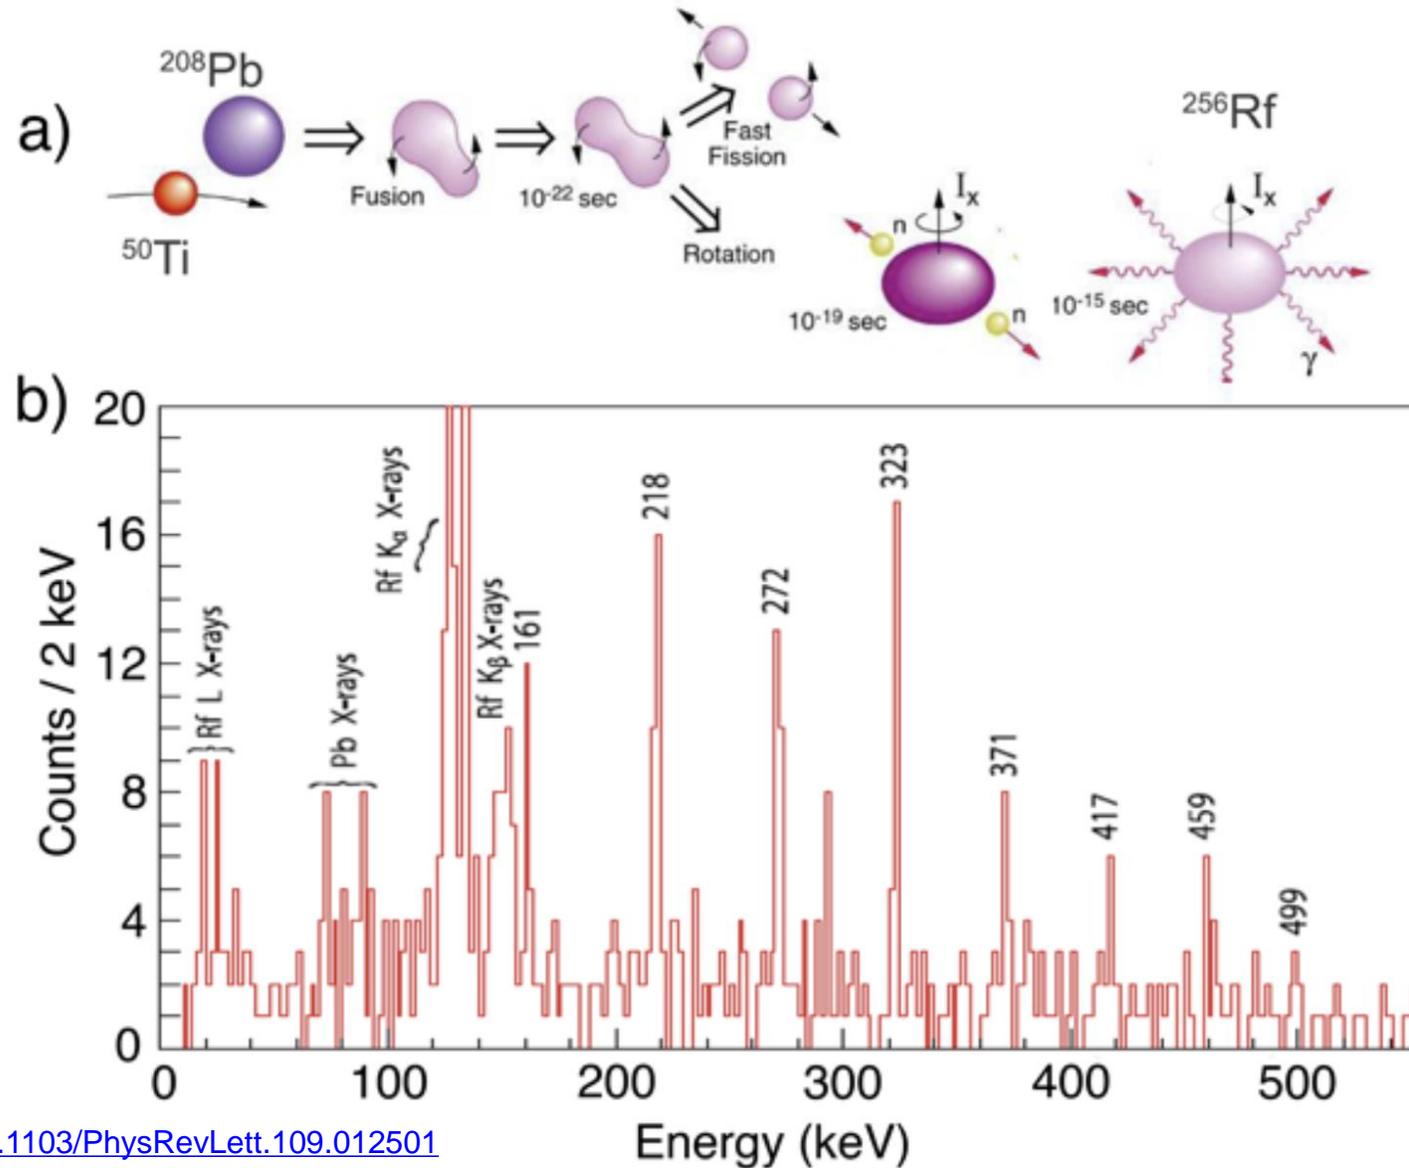

GRETINA

# In-beam Spectroscopy

Observed gamma ray spectrum from the de-excitation of  $^{256}\text{Rf}$

Picket-fence pattern  $\rightarrow$  emission of photons from rotational states  $\rightarrow$   $^{256}\text{Rf}$  is quadrupole-deformed

Spacing on picket-fence pattern  $\rightarrow$  rotational moment of inertia  $\rightarrow$  orbital level density (bigger energy gap  $\rightarrow$  higher moment of inertia)

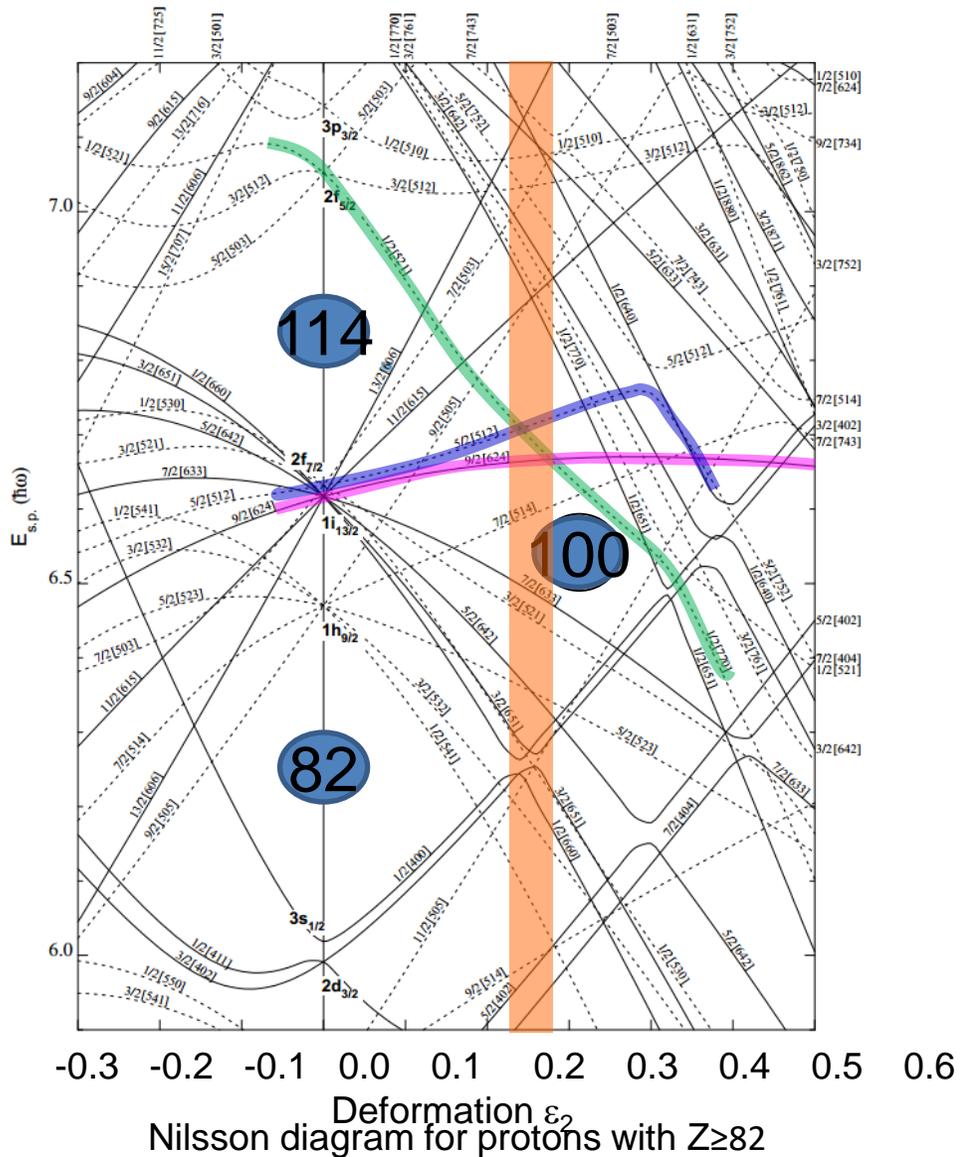

Greenlees, P.T. Phys. Rev. Lett., **109** (2012) 012501: <http://link.aps.org/doi/10.1103/PhysRevLett.109.012501>

# Spectroscopy:

K-Isomer: excited metastable states that are found amongst the rotational states of deformed atomic nuclei

# Determining Location of the Next Shells

Single-particle states responsible for the stability of SHE can be probed via:

- 1) States which are near the ground state in deformed nuclei near  $Z=102$  are also near the ground state for spherical SHE. We can study these states in  $Z=102-104$  with production rates of up to atoms per second.
- 2) We can produce SHE at rates of nearly 1 atom per day. New capabilities allow us to perform spectroscopy directly with SHE.

# K-isomers in $^{256}\text{Rf}$

 (0<sup>+</sup>) —————

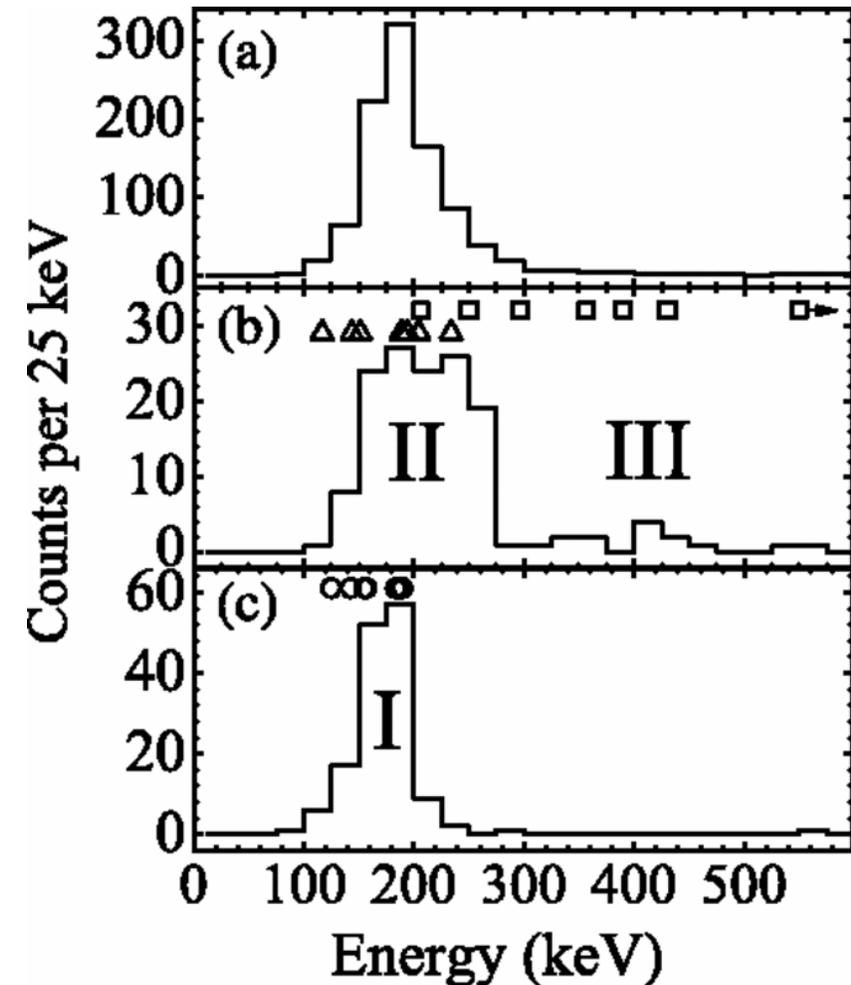

- Looking to observe low-energy (10-1000s of keV) signals just before the alpha/fission decay of a heavy element  
 → decay of isomeric state
- Measure energy of transitions and photons emitted during decay → build level scheme to identify nuclear levels

Jeppeson: Phys. Rev. C **79** (2009) 031303 <http://dx.doi.org/10.1103/PhysRevC.79.031303>

# K-isomers in $^{256}\text{Rf}$

Photons emitted with electrons

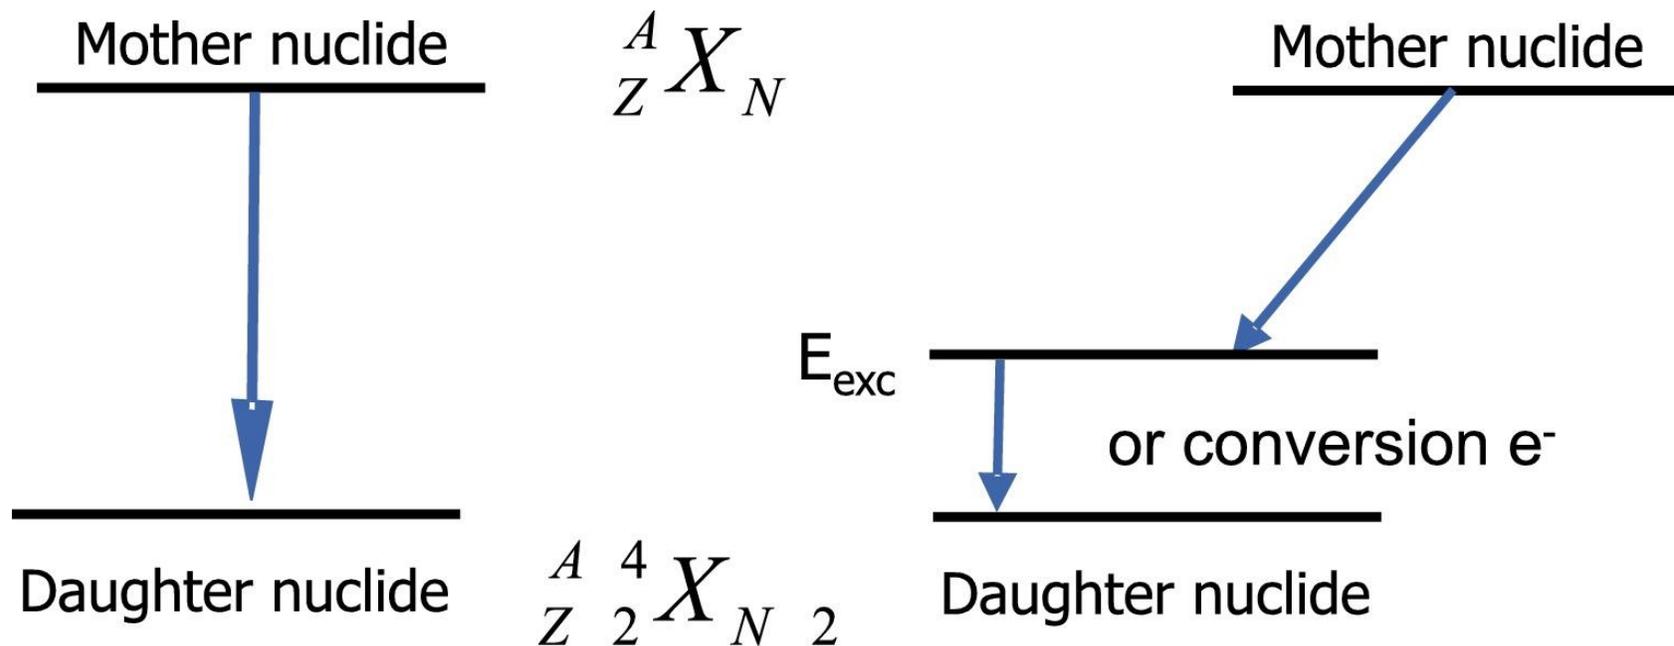

Electrons observed in silicon detector

Jeppeson: Phys. Rev. C **79** (2009) 031303 <http://dx.doi.org/10.1103/PhysRevC.79.031303>

# Spectroscopy: Alpha-gamma

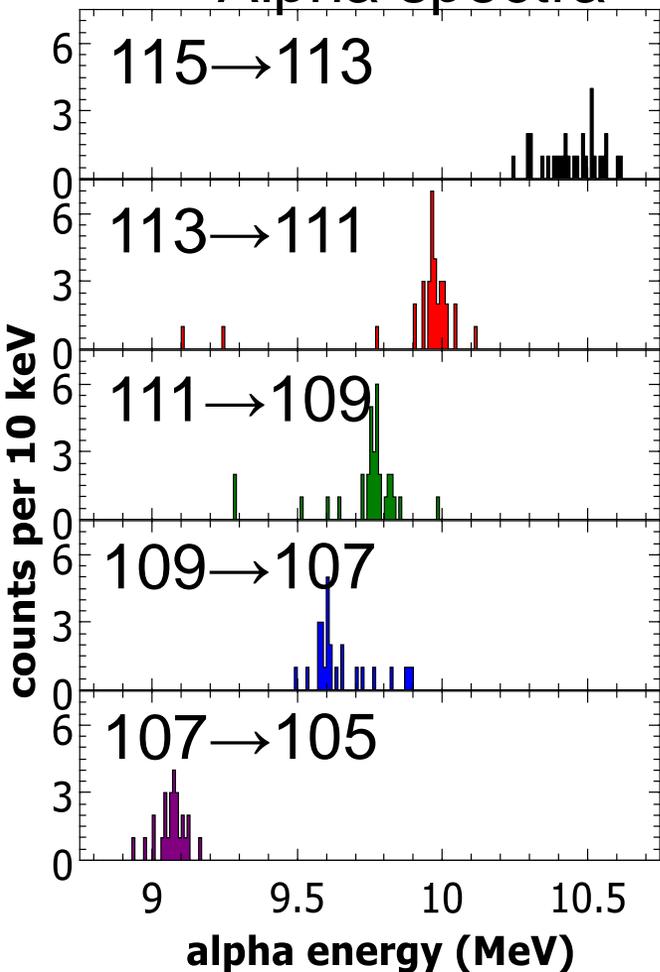

# Alpha-gamma spectroscopy

Look for gamma or conversion electron decay in coincidence with alpha decay

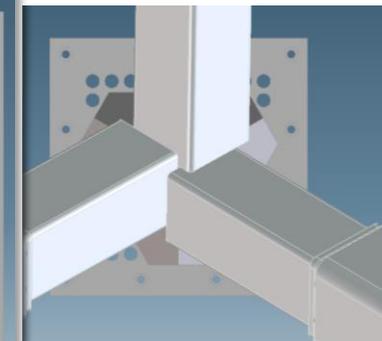

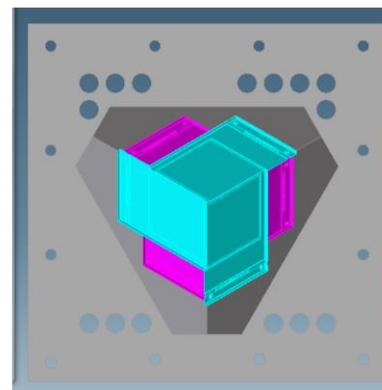

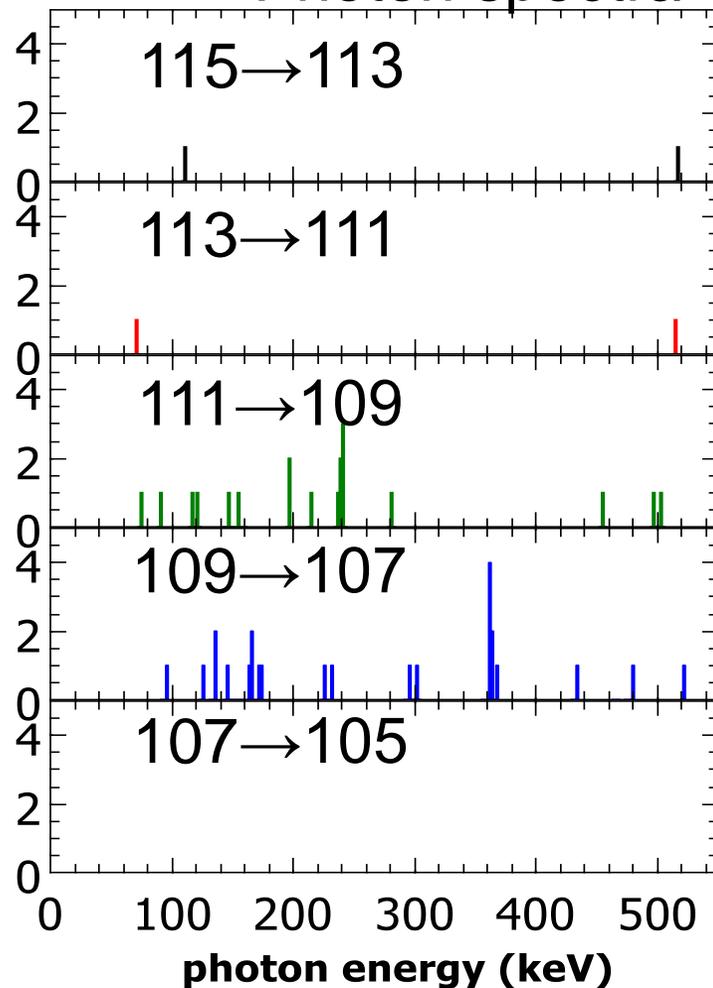

# Decay Spectroscopy of E115

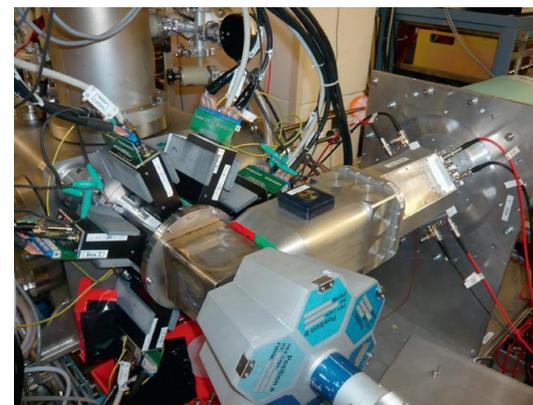

Alpha spectra

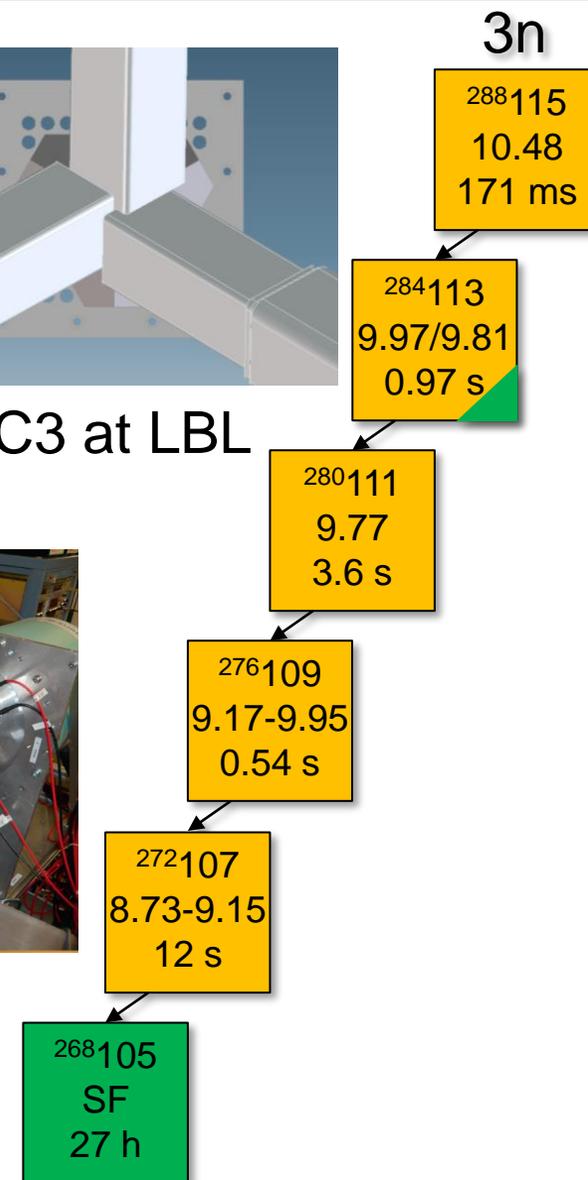

Photon spectra

C3 at LBL

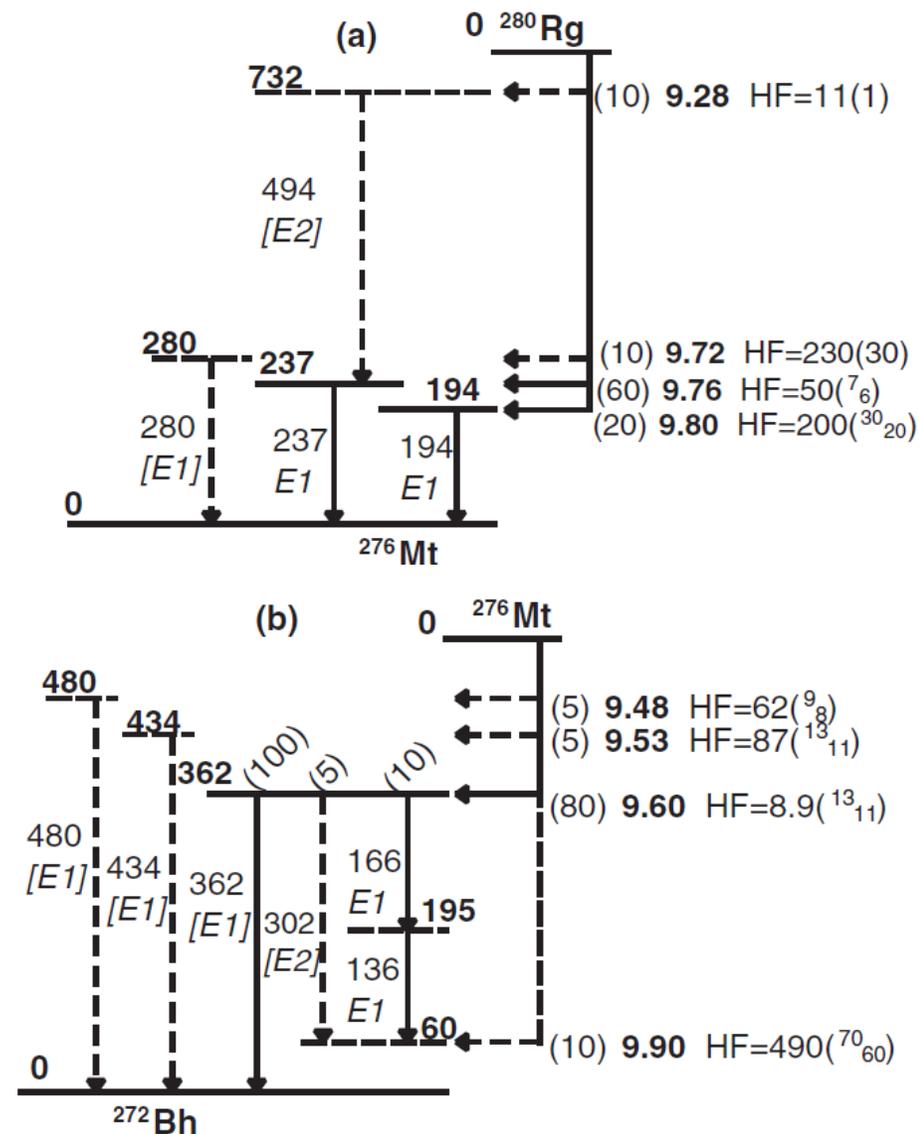

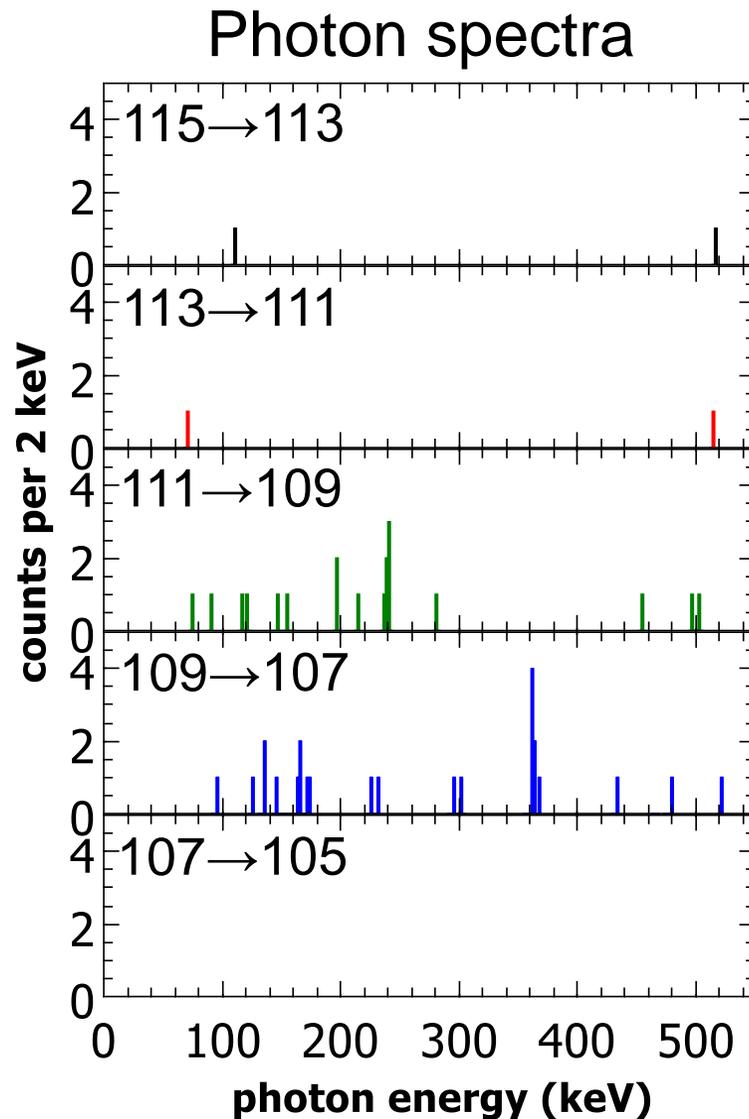

TASISpec

# Decay Spectroscopy of Element 115

- Observed photons in coincidence with alpha-decay
- Develop level scheme for low-lying states in  $^{276}109$  and  $^{272}107$
- Determine multipolarities for several transitions
- Close to identifying single-particle states

# Heavy Element Chemistry

Challenges with heavy element chemistry:

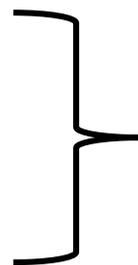

Only make one atom-at-a-time

Atoms formed with the momentum of the beam  $\rightarrow$  36000 m/s

Transactinides are short-lived with lifetimes of minutes or less

## Common Techniques

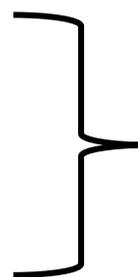

- Gas chromatography
- Ion exchange
- Solvent extraction

Provide qualitative information only:  
Does 112 behave more like Hg or Rn?  
Does 105 form volatile chlorides?

## Up & Coming Techniques:

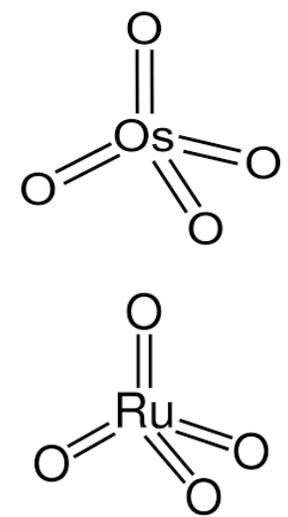

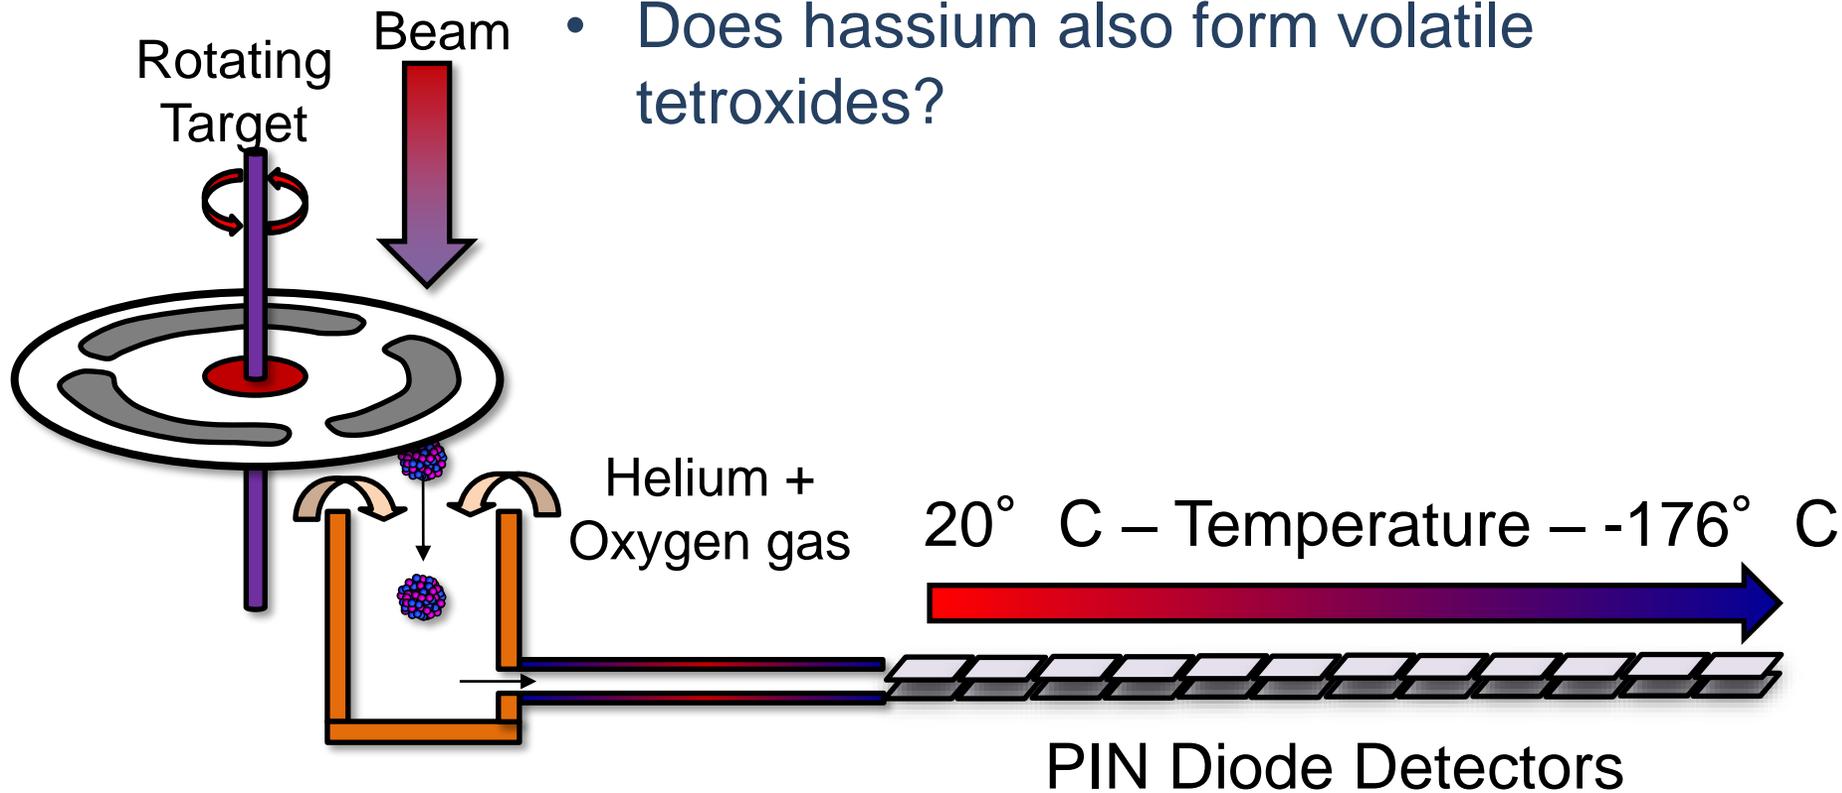

- Laser spectroscopy
- Mass Analyzers

Provide quantitative information:  
What is the first excited atomic state of Rf?  
Is it  $\text{Sg}(\text{CO})_6$  or  $\text{Sg}(\text{CO})_5$ ?

# First (and only) Chemistry on Hassium

- Os and Ru both known to form volatile tetroxides in the presence of oxygen and heat
- Does hassium also form volatile tetroxides?

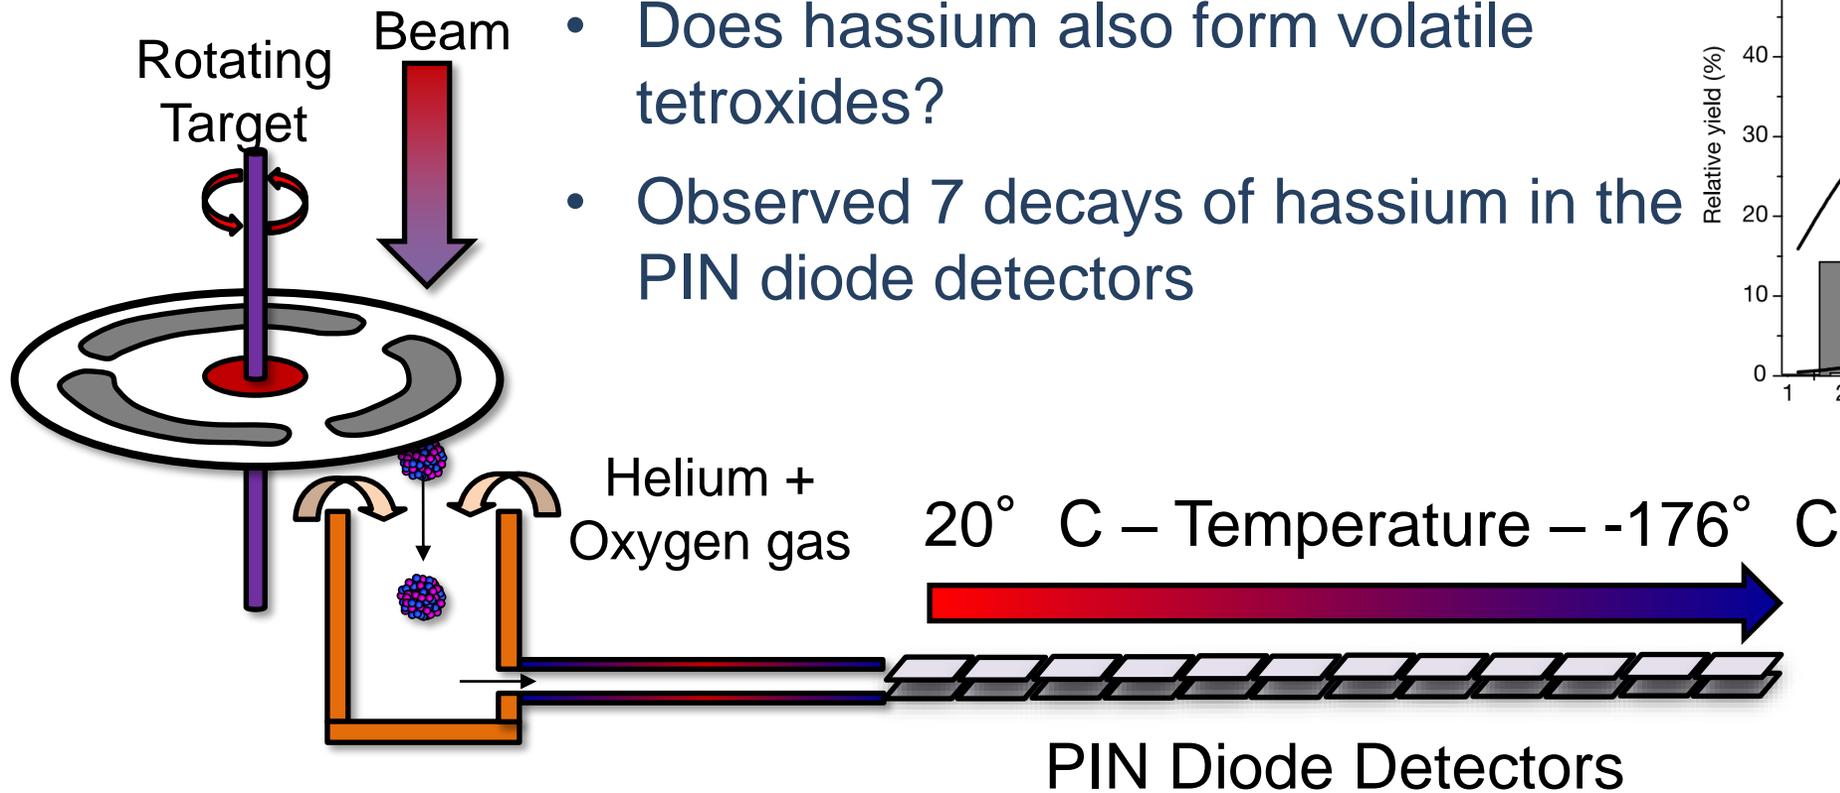

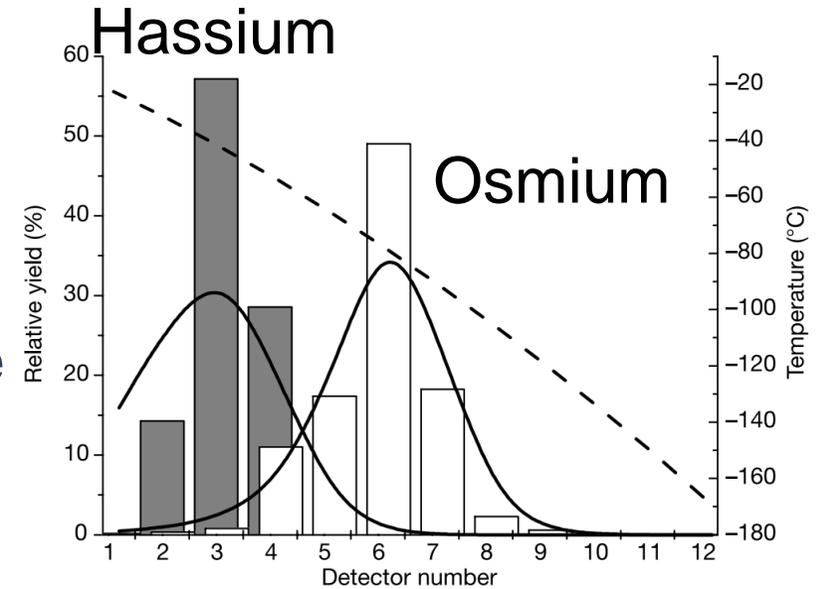

26	<b>Fe</b> Iron 55.845
44	<b>Ru</b> Ruthenium 101.07
76	<b>Os</b> Osmium 190.23
108	<b>Hs</b> Hassium [269]

Duellmann, Ch.E. Nature **418** (2002) 859: <https://doi.org/10.1038/nature00980>

# First (and only) Chemistry on Hassium

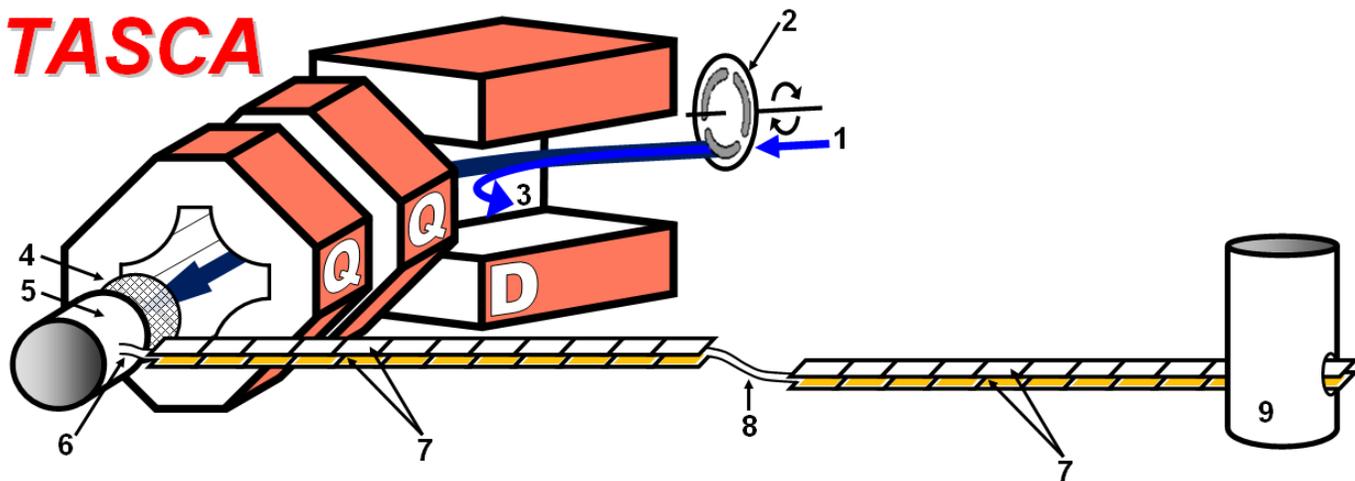

- Os and Ru both known to form volatile tetroxides in the presence of oxygen and heat
- Does hassium also form volatile tetroxides?
- Observed 7 decays of hassium in the PIN diode detectors

Duellmann, Ch.E. Nature **418** (2002) 859: <https://doi.org/10.1038/nature00980>

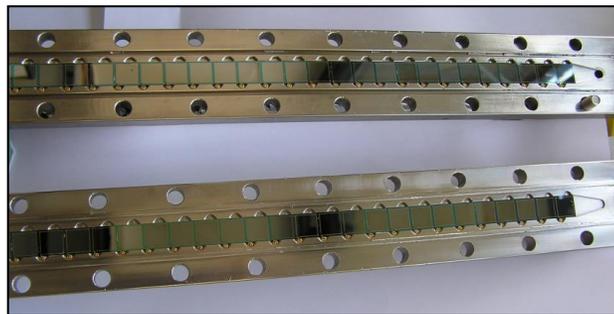

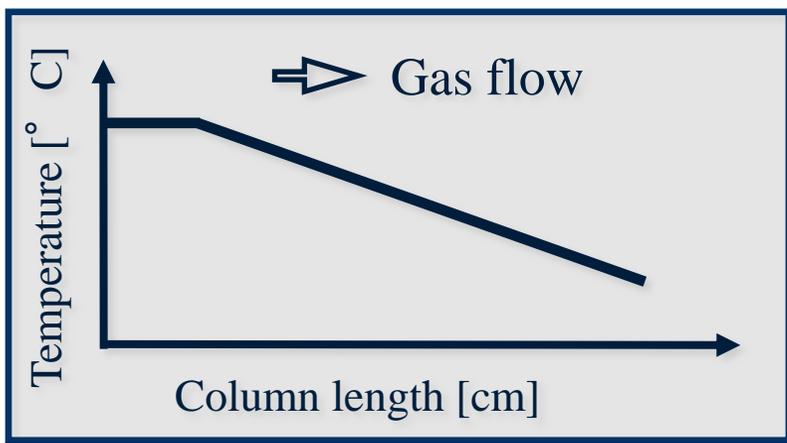

# Thermal Chromatography of E114 and E112

# Seaborgium Carbonyl Chemistry

Mo and W form volatile hexacarbonyls in the presence of carbon monoxide (CO)

Does Sg form these same complexes?

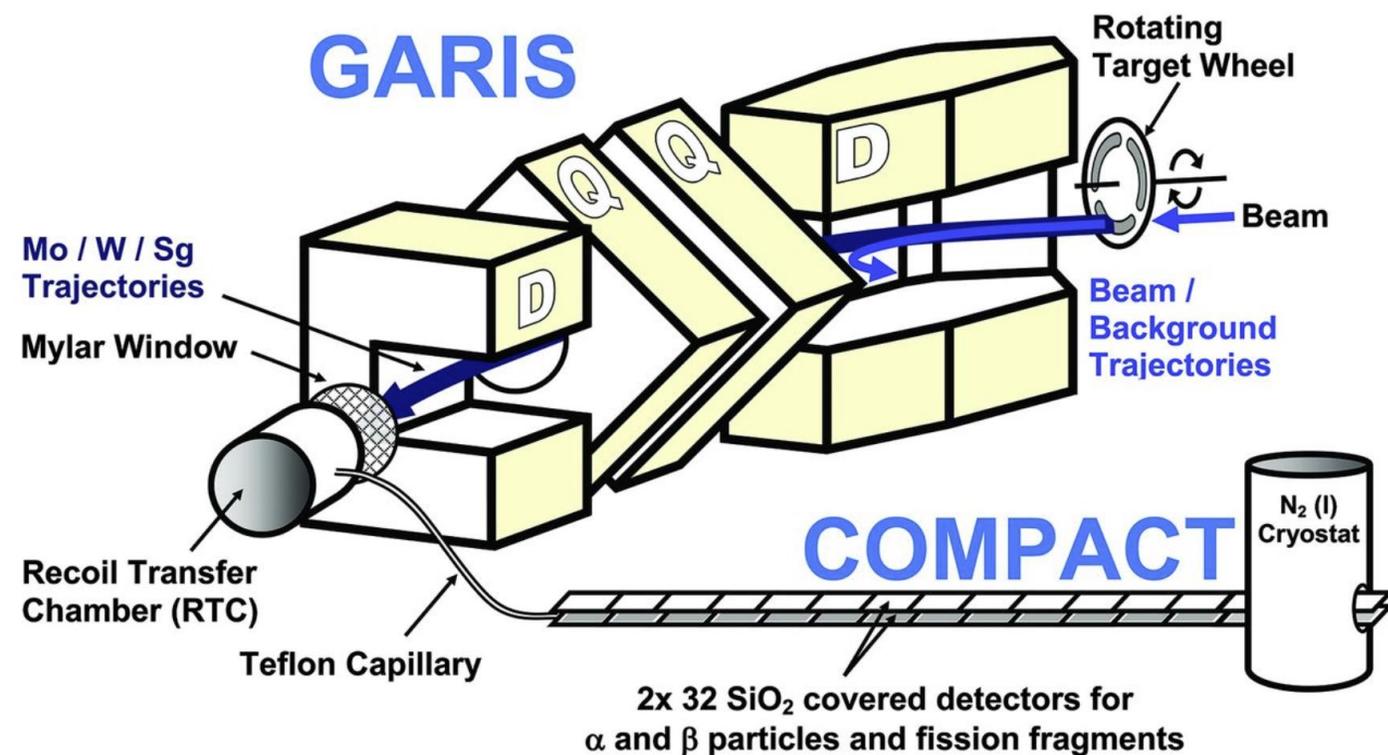

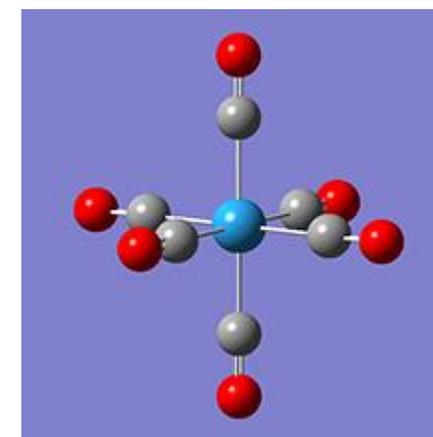

Fig. 1 Schematic drawing of the experimental setup.

6	VIB	6B
24	<b>Cr</b>	Chromium 51.996
42	<b>Mo</b>	Molybdenum 95.95
74	<b>W</b>	Tungsten 183.84
106	<b>Sg</b>	Seaborgium [266]

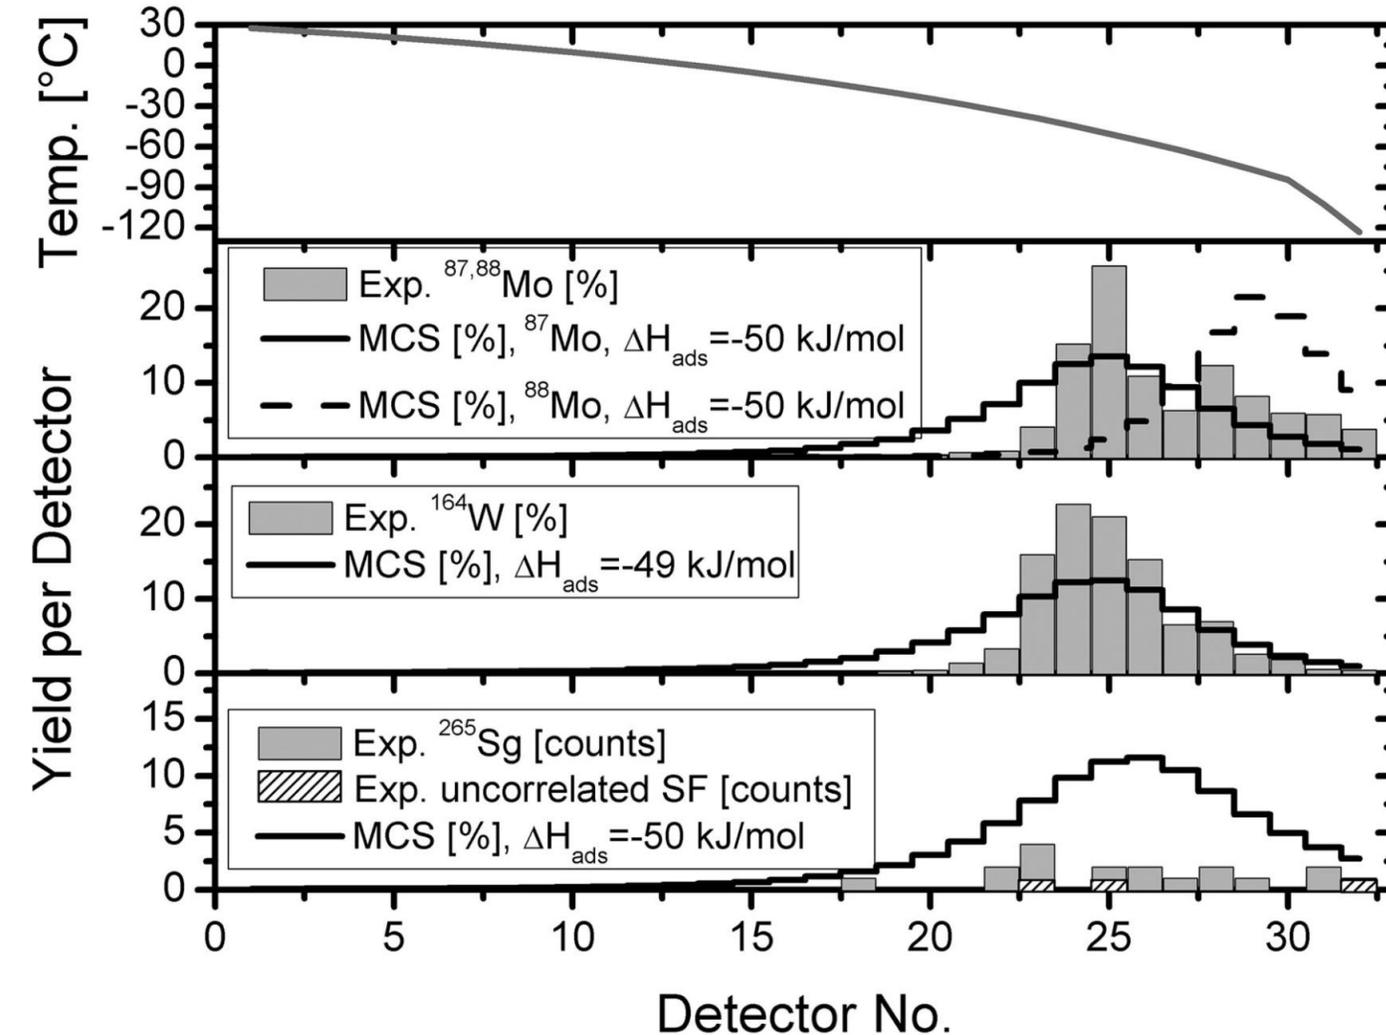

Even, J., Science, **345** (2014) 1491: <https://doi.org/10.1126/science.1255720>

# Seaborgium Carbonyl Chemistry

Sg reacted with CO at exit of GARIS

Sg has similar volatility to Mo and W

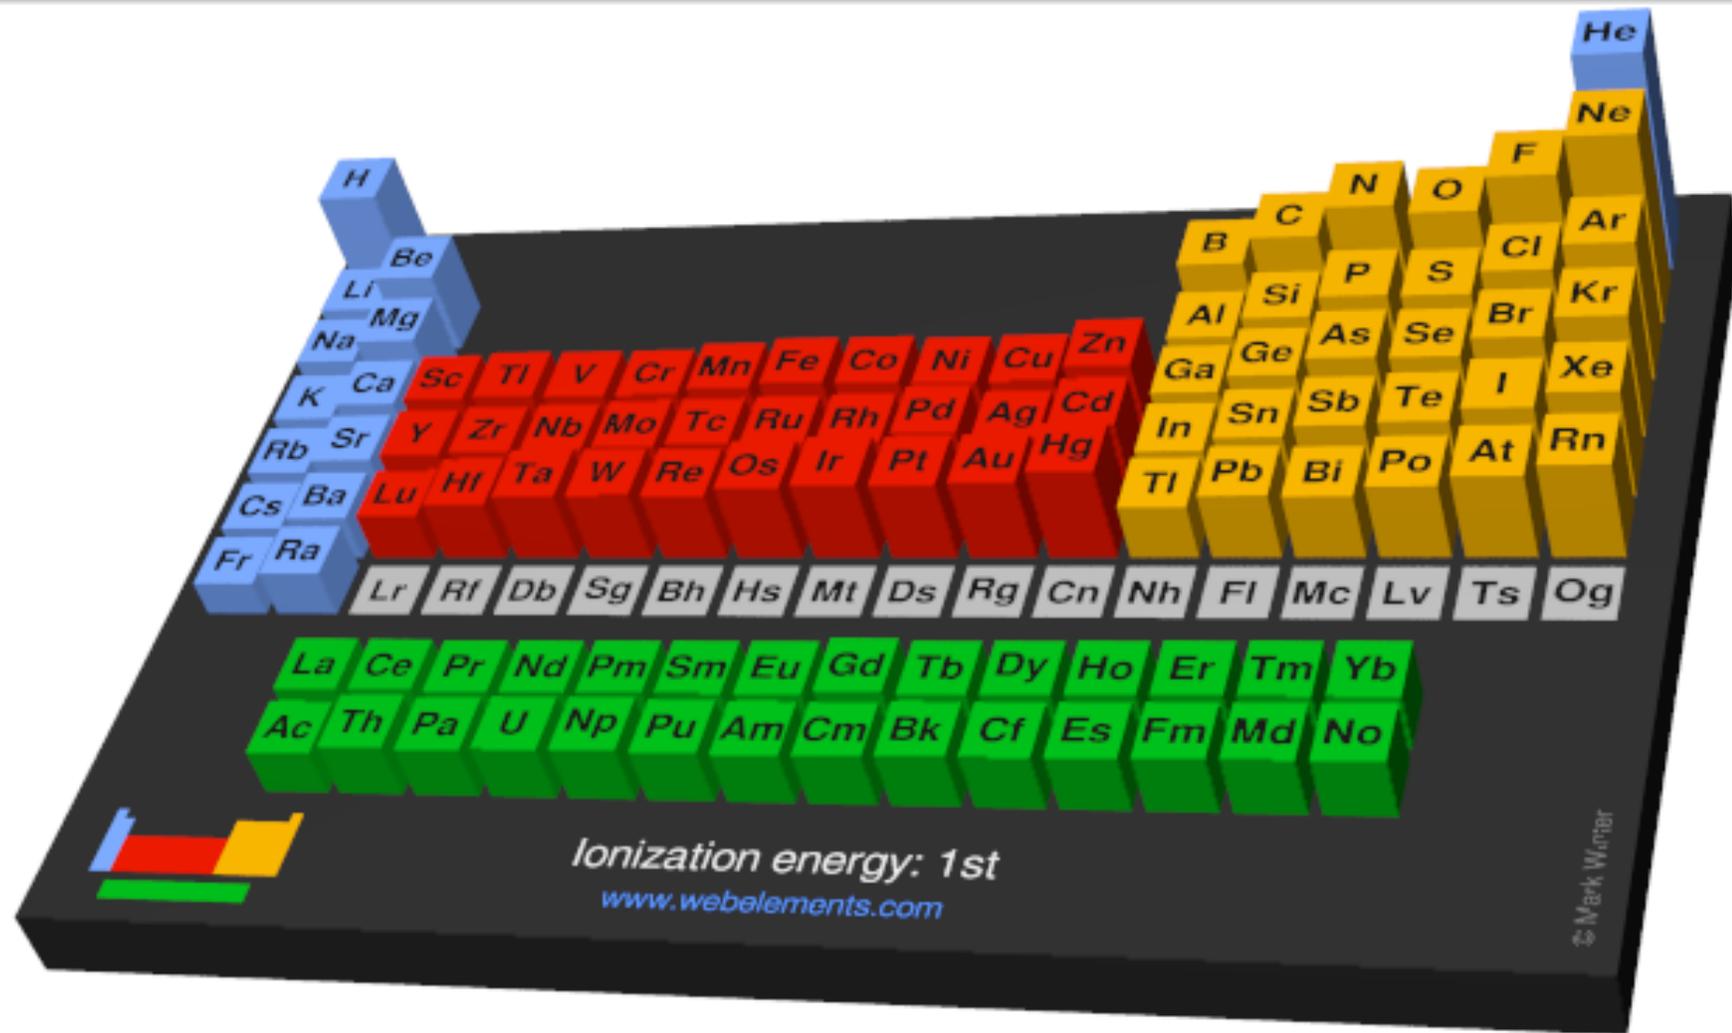

**Question:** what is missing from these chemistry experiments?

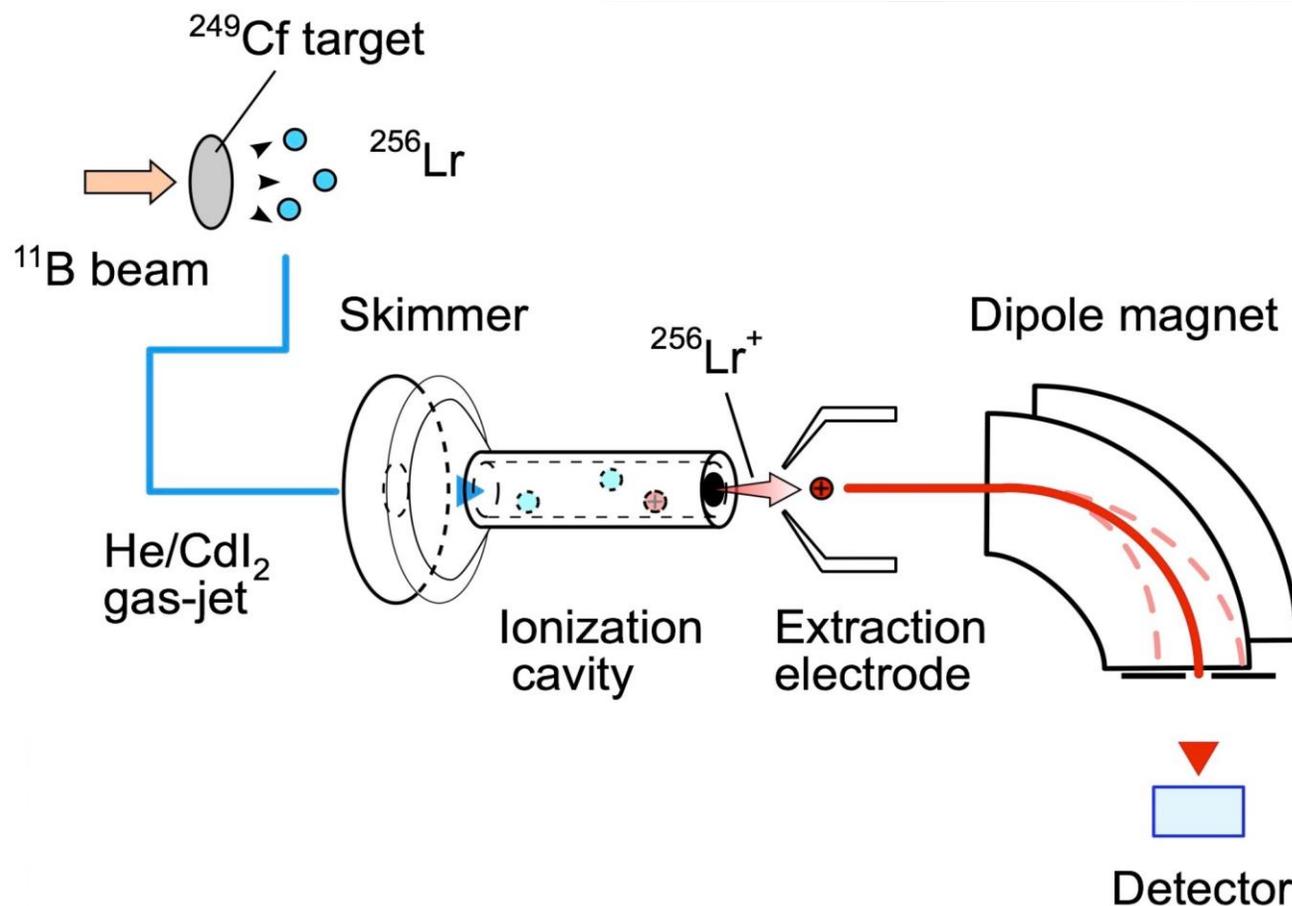

Even, J., Science, **345** (2014) 1491: <https://doi.org/10.1126/science.1255720>

# Ionization Potentials

Ionization potential → How much energy is required to remove electron from an element

# Ionization Potential of Lawrencium ( $Z=103$ )

1. Produced  $^{256}\text{Lr}$  and neutralized it in a He/CdI<sub>2</sub> gas mixture
2. Transported  $^{256}\text{Lr}$  atoms to ionization cavity
3. Ionized  $^{256}\text{Lr}$  on tantalum surface
4. Counted number of  $^{256}\text{Lr}$  ionized

Sato, T.K.: Nature **520**, 209 (2015): <https://doi.org/10.1038/nature14342>

Sato, T.K.: JACS **140** (2018) 14609: <https://doi.org/10.1021/jacs.8b09068>

# Ionization Potential of Lawrencium (Z=103)

Well-known relationship between ionization efficiency and ionization potential

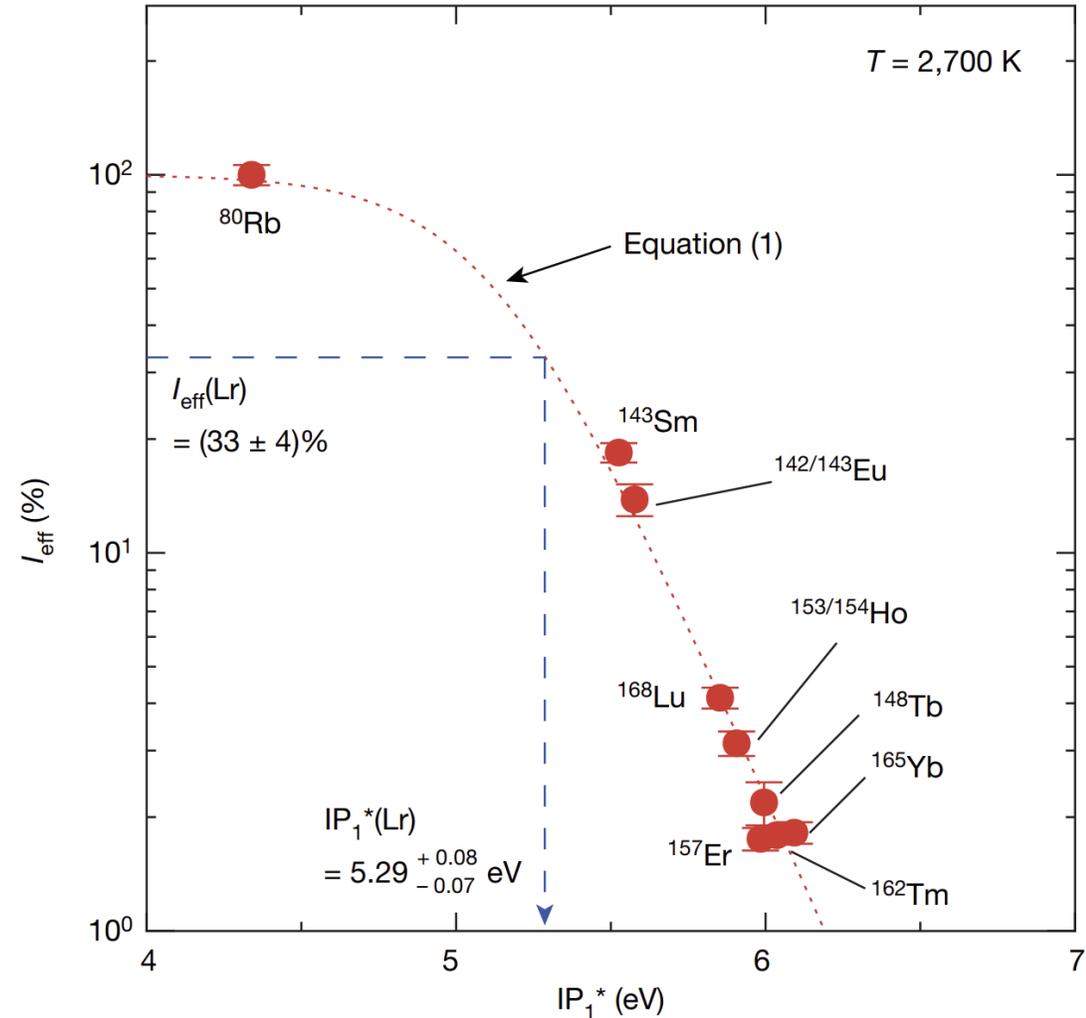

$$I_{\text{eff}} = \frac{N \exp\left(\frac{\phi - IP_1^*}{kT}\right)}{1 + N \exp\left(\frac{\phi - IP_1^*}{kT}\right)} \quad (1)$$

$\phi$  = material dependent work function

$k$  = Boltzmann constant

$T$  = temperature of ionizing surface

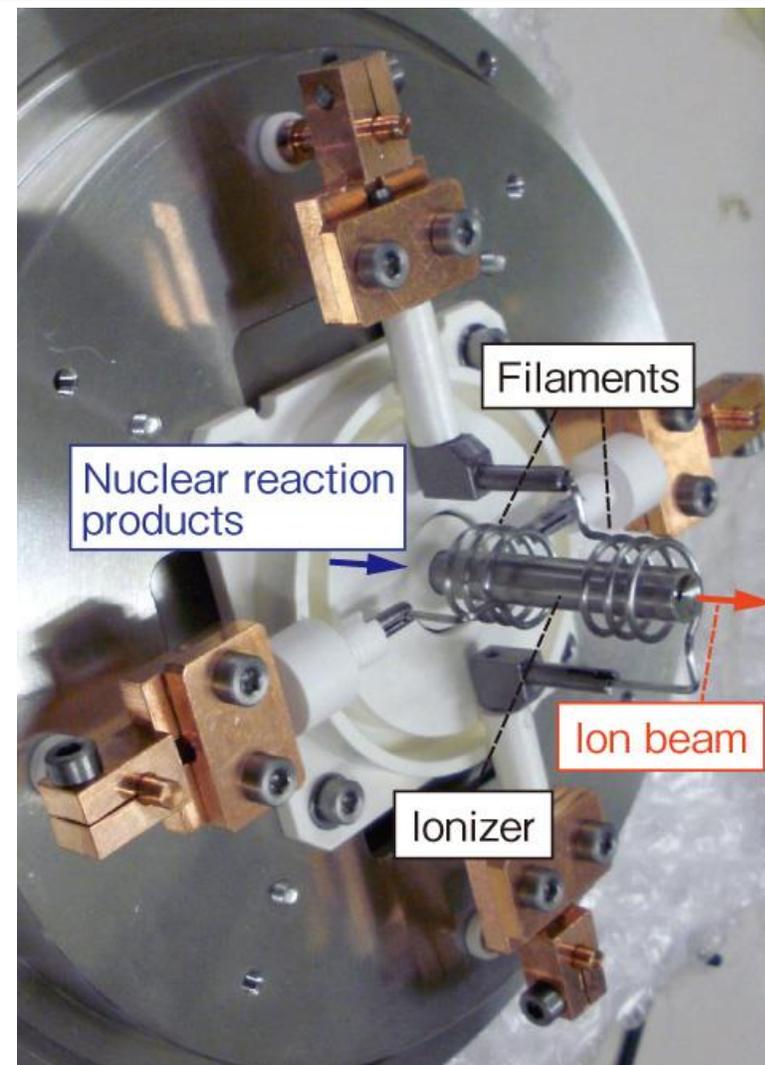

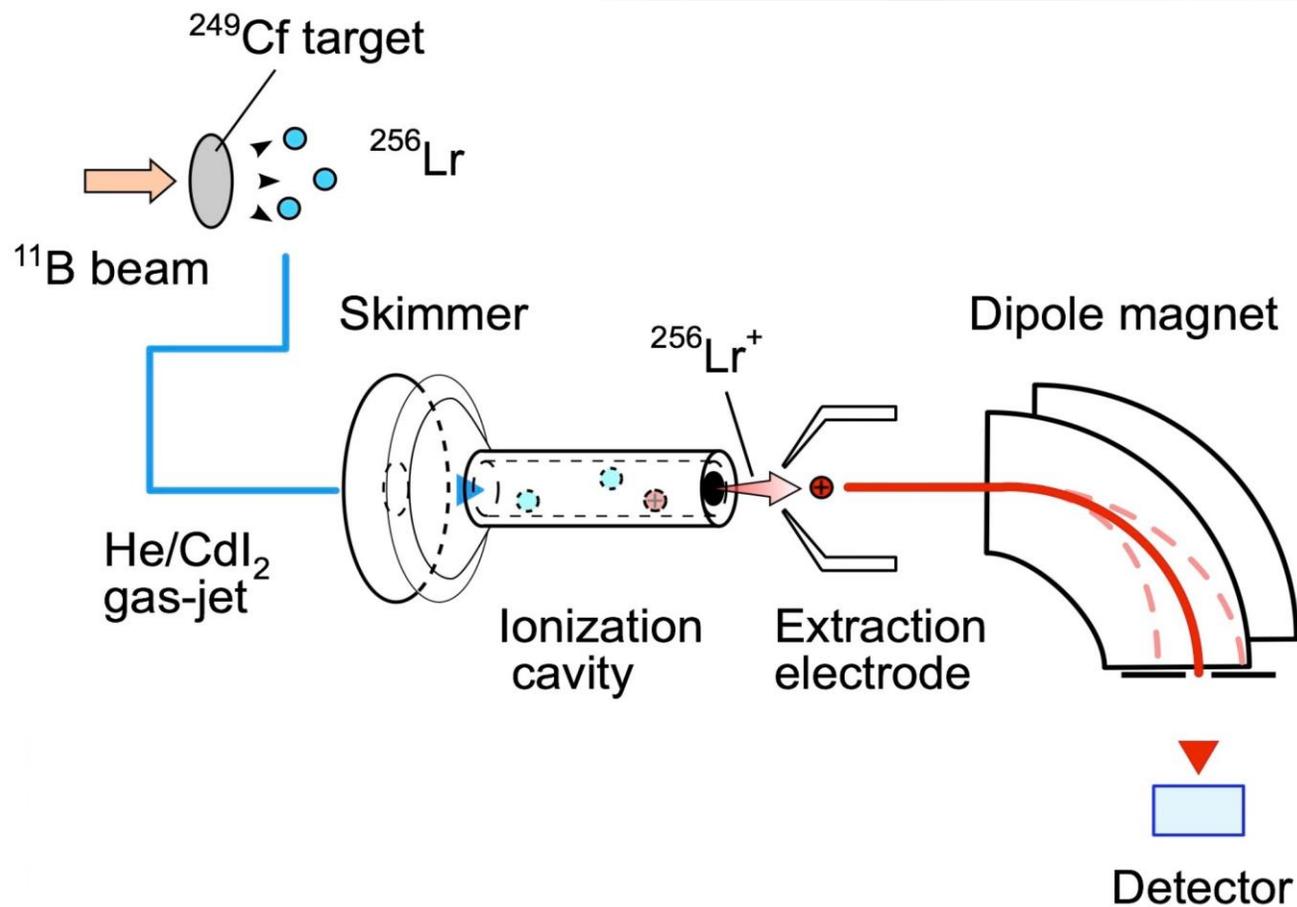

$N$  = effective number of atom-surface interactions

Sato, T.K.: Nature **520**, 209 (2015): <https://doi.org/10.1038/nature14342>

Sato, T.K.: JACS **140** (2018) 14609: <https://doi.org/10.1021/jacs.8b09068>

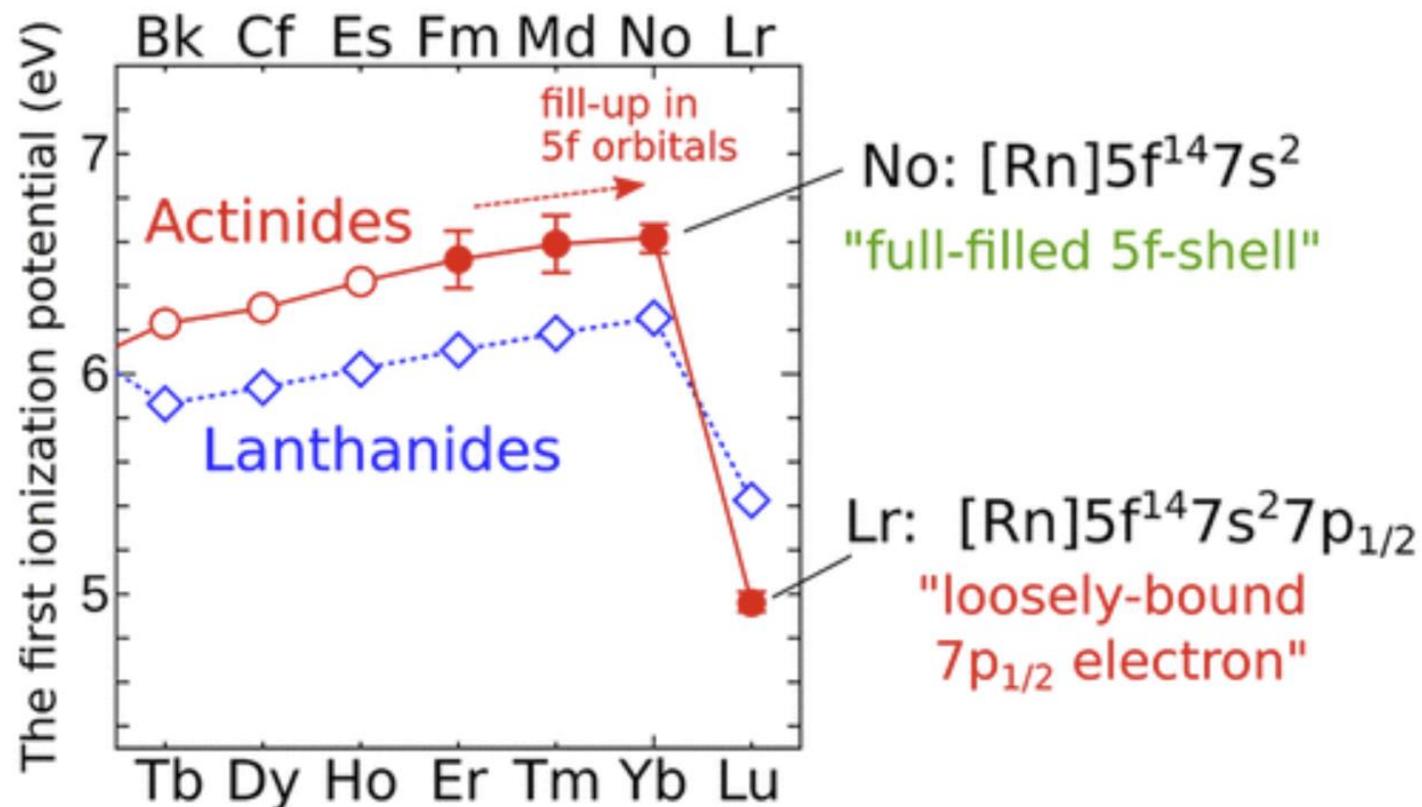

# Ionization Potential of Lawrencium ( $Z=103$ )

Sato, T.K.: Nature **520**, 209 (2015): <https://doi.org/10.1038/nature14342>  
Sato, T.K.: JACS **140** (2018) 14609: <https://doi.org/10.1021/jacs.8b09068>

# Ionization Potential of Lawrencium (Z=103)

- Measured No and Lr ionization potentials
- Lr has the most weakly-bound valence electron among all actinides
- Confirmed that No closes out the actinide series

Sato, T.K.: Nature **520**, 209 (2015): <https://doi.org/10.1038/nature14342>

# Laser Spectroscopy

# Laser Spectroscopy

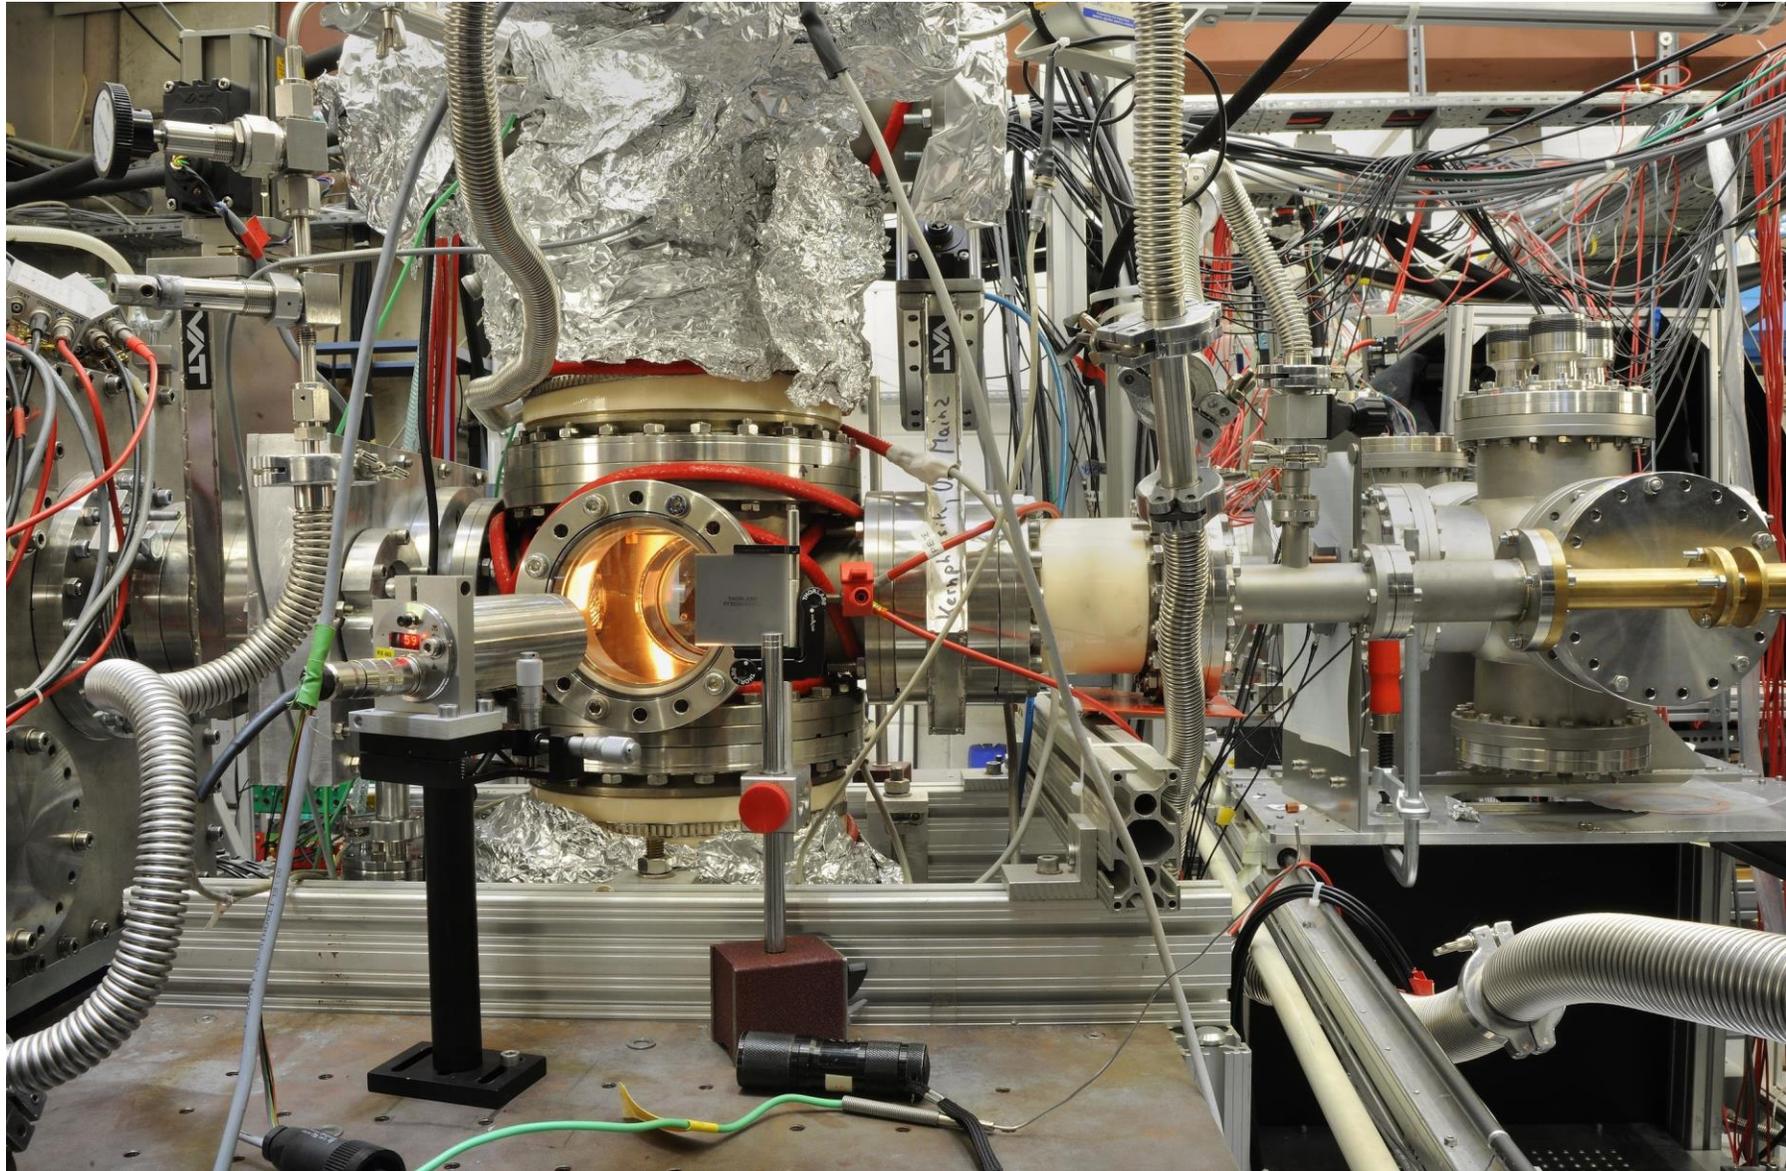

Energies of Nobelium atomic orbitals probed through RADIS (RADiation Detected Resonant Ionization Spectroscopy)

1. Ion stopped (charged) in helium buffer gas
2. Accumulate and are neutralized on filament
3. Re-evaporated as neutral atoms
4. Excited by a two-step photoionization technique
5. Ions guided to silicon detector

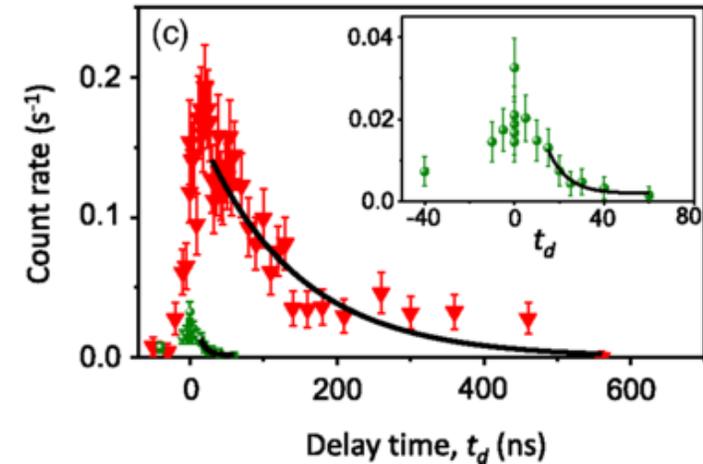

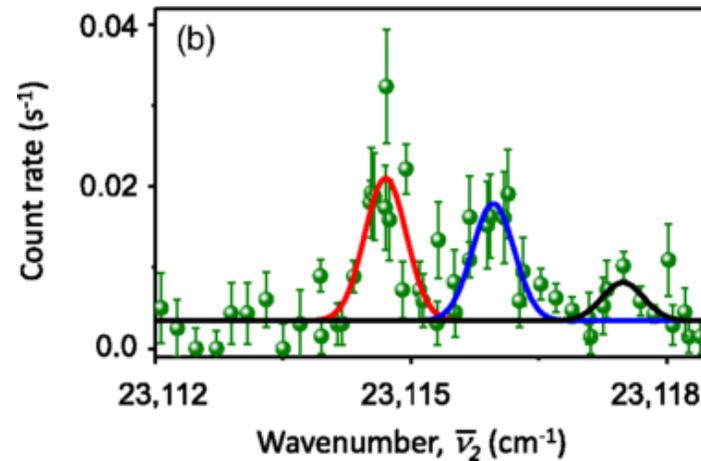

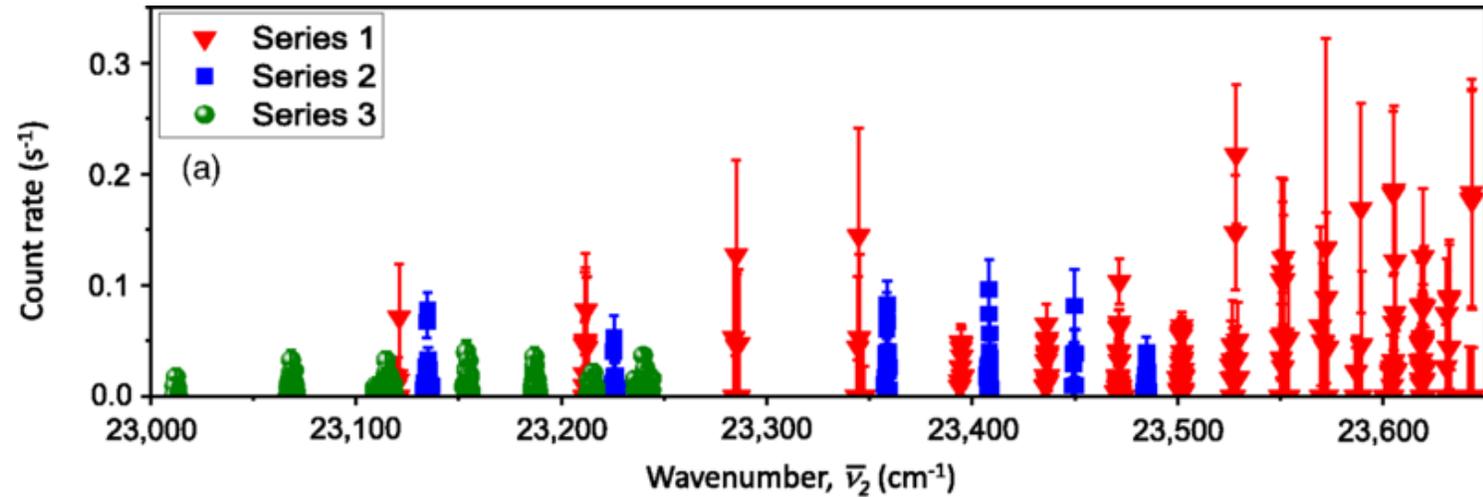

Block, M., Nucl. Phys. A, **944** (2015) 471: <https://doi.org/10.1016/j.nuclphysa.2015.09.009>

Block, M. La Rivista del Nuovo Cimento **45** (2022) 279: <https://doi.org/10.1007/s40766-022-00030-5>

Measured atomic levels of  $^{254}\text{No}$  – Identified 30 Rydberg states – highly excited electronic states of an atom

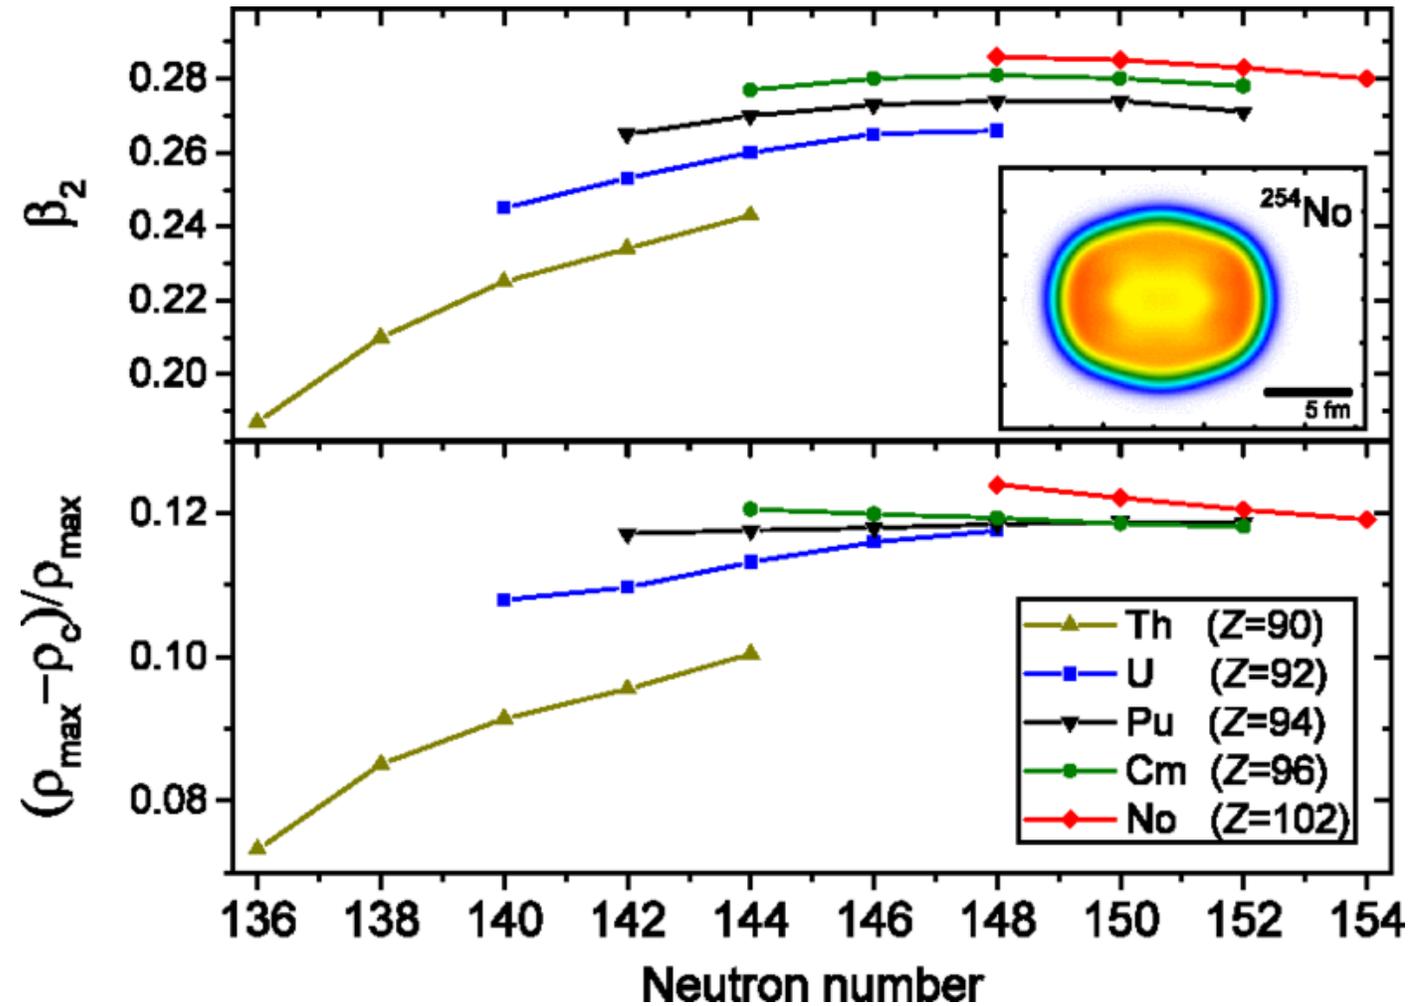

Chhetri, P. Phys. Rev. Lett. **120** (2018) 263003: <https://doi.org/10.1103/PhysRevLett.120.263003>

# Laser Spectroscopy of Nobelium

Deformation parameter  $\beta_2$   
for even-even isotopes

Relative depth of central  
depression:

$^{252,253,254}\text{No}$  = strong quadrupole  
deformation with central depression

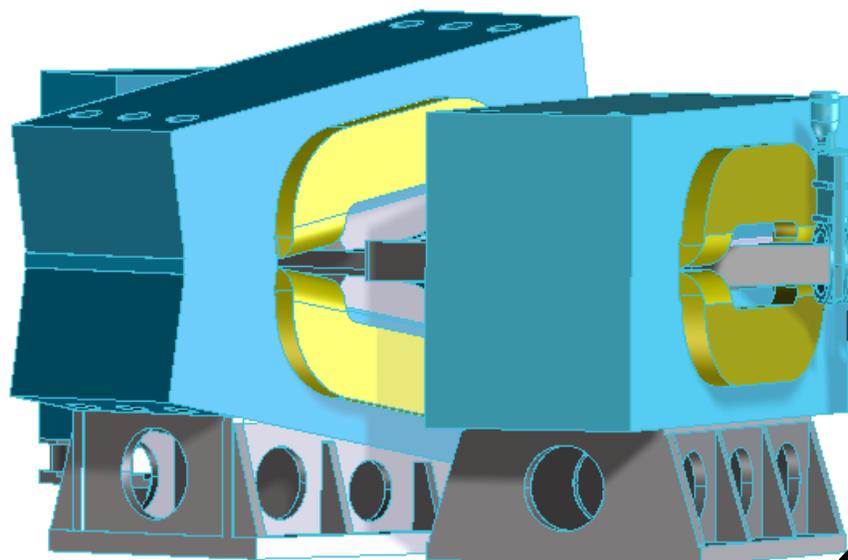

Raeder, S. Phys. Rev. Lett. **120** (2018) 232503: <https://doi.org/10.1103/PhysRevLett.120.232503>

# Chemistry with Mass Measurements

# BGS + FIONA: The Concept

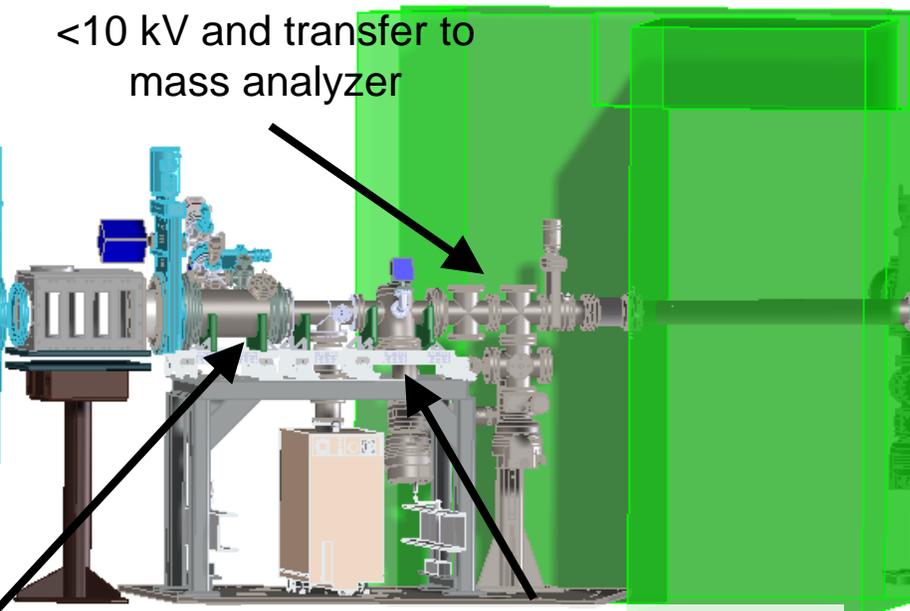

## Berkeley Gas-filled Separator

Produce heavy element isotopes, separate from beam and other nuclear reaction products

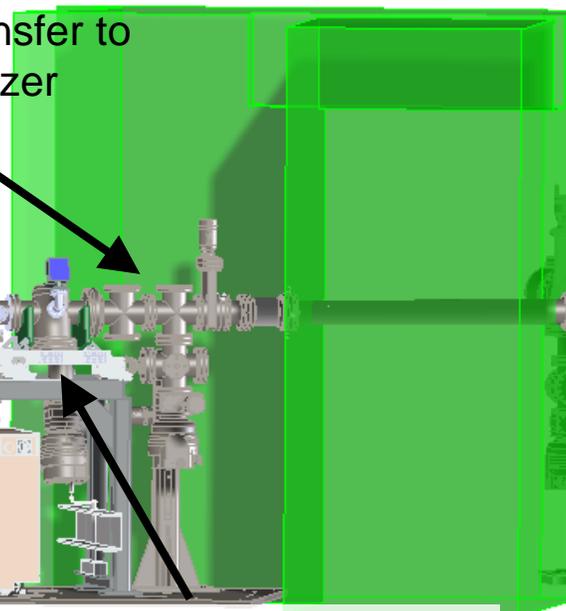

## Acceleration Region

re-accelerate ions to <math><10\text{ kV}</math> and transfer to mass analyzer

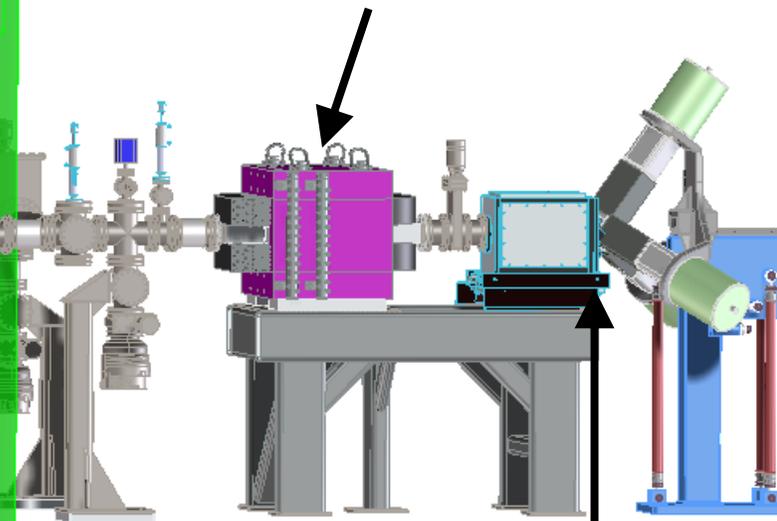

## Shielding Wall

allow detection in low-background environment

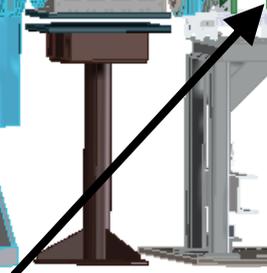

## Trochoid Spectrometer

disperse products by  $A/q$

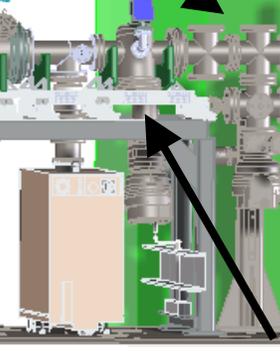

## RF Gas Catcher

stop ions He gas, RF and DC E-fields direct ions to an exit orifice

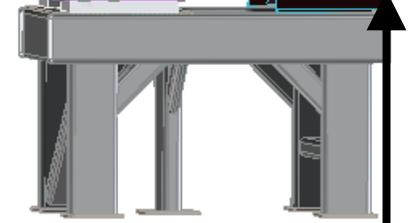

## RF Quadrupole Trap

bunch and cool ions, Add in reactive gasses and perform chemistry

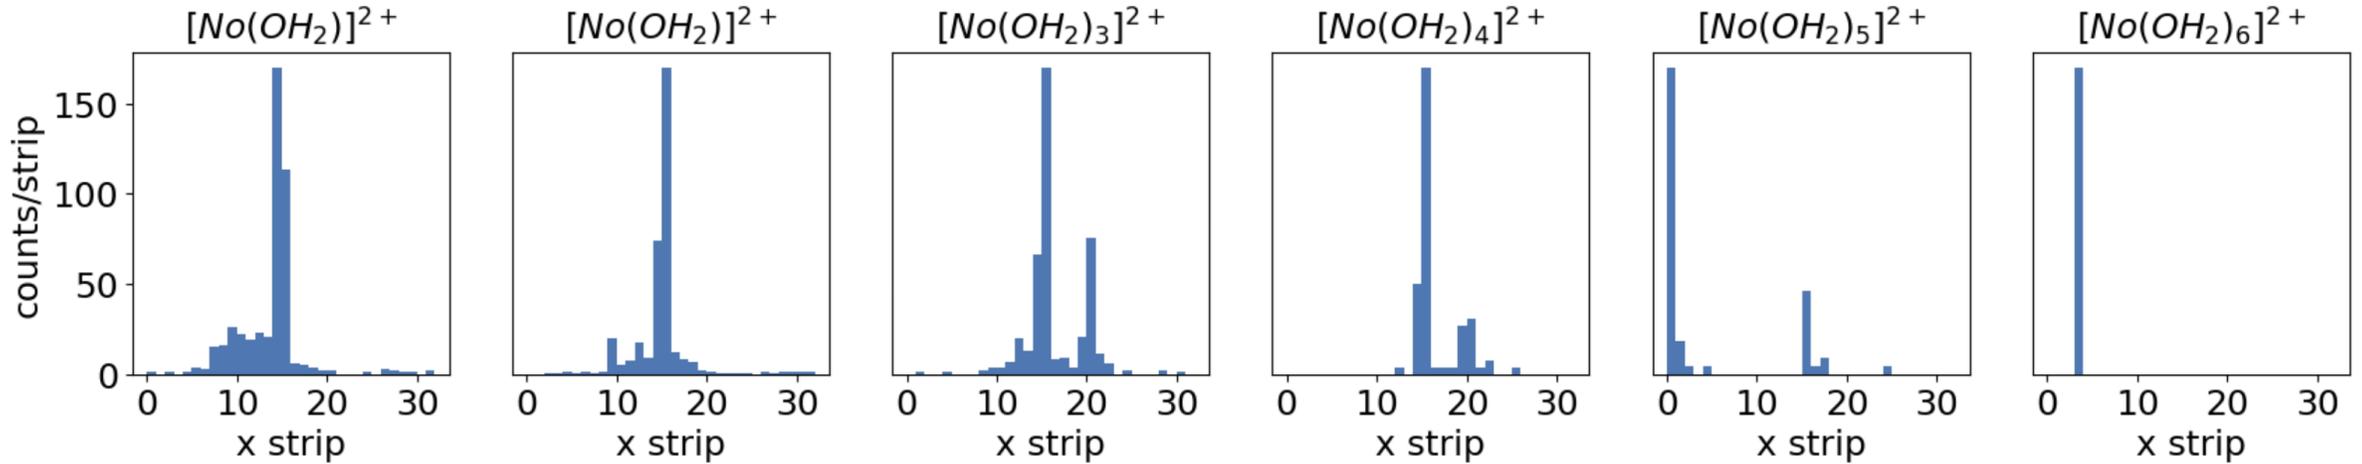

## Detector Station

$AZ$  from  $\alpha$ -decay  
mass from  $x$ -position  
lifetime from  $y$ -position

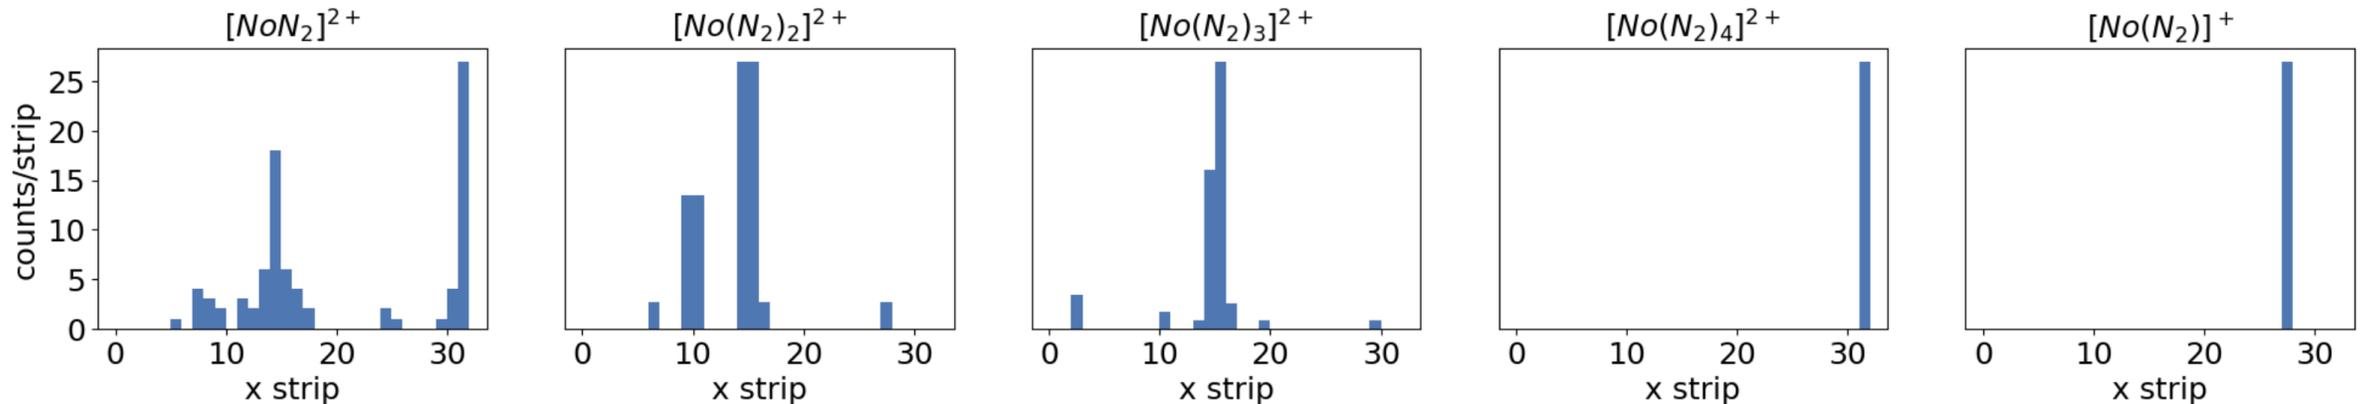

# Other Fun Nobelium Complexes

Observed nobelium with 1-5 waters  
Hints of small amounts of nobelium with mixtures of H<sub>2</sub>O, OH and O

And Nobelium with 1-3 N<sub>2</sub> or CO

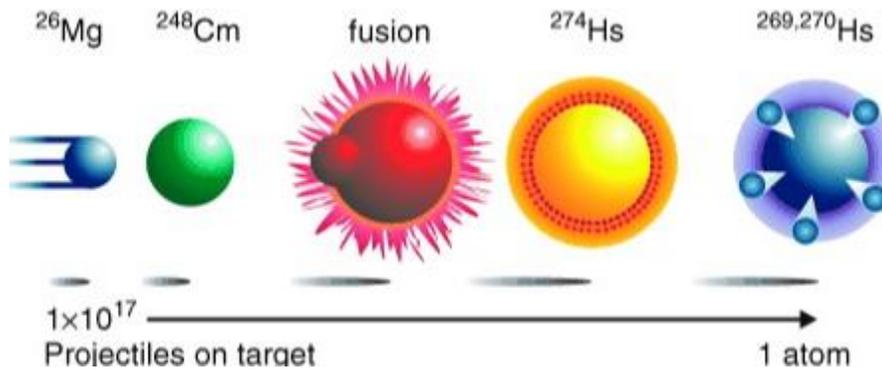

Where do we go from  
here?

# Types of Fusion Reactions

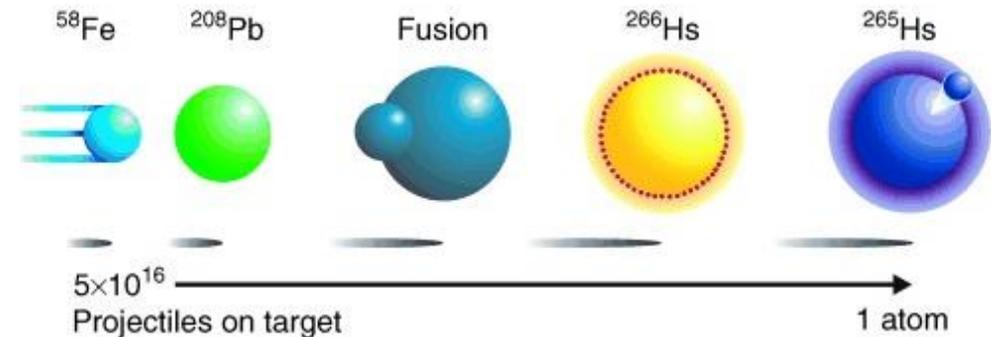

## Hot Fusion

- Fusion of light ion beams ( $^{18}\text{O}$ ,  $^{22}\text{Ne}$ ,  $^{40}\text{Ar}$ ,  $^{48}\text{Ca}$ ) with actinide targets

## Cold Fusion

- Fusion of transition metals ( $^{48}\text{Ca}$ ,  $^{50}\text{Ti}$ ,  $^{54}\text{Cr}$ , etc) with Pb or Bi targets

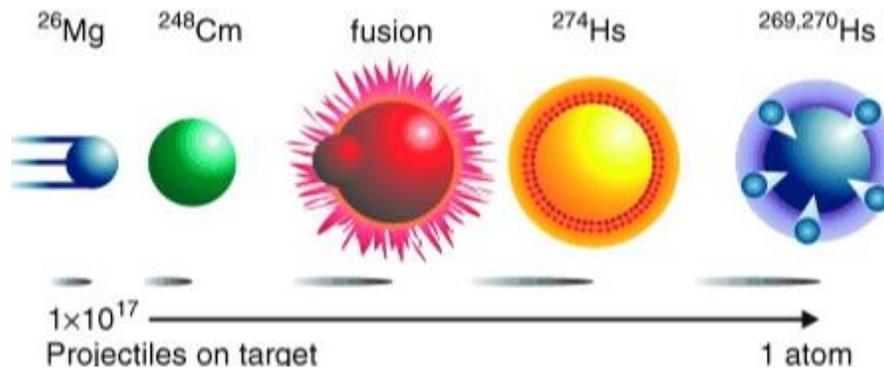

Excitation energy for a reaction:

$$E^* = E_{cm} - (m_{beam} + m_{target} - m_{product})$$

# Types of Fusion Reactions

## Hot Fusion

- Fusion of light ion beams ( $^{18}\text{O}$ ,  $^{22}\text{Ne}$ ,  $^{40}\text{Ar}$ ,  $^{48}\text{Ca}$ ) with actinide targets

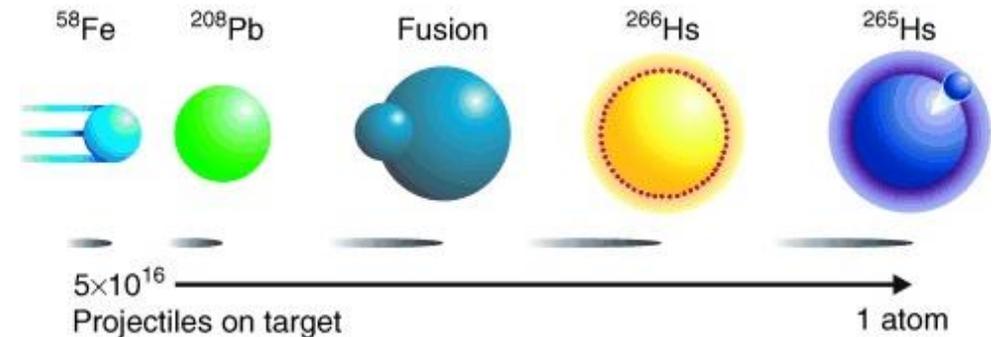

Bass barrier  $\approx 125 \text{ MeV } E_{\text{cm}}$

$E^* \approx 40 \text{ MeV}$

## Cold Fusion

- Fusion of transition metals ( $^{48}\text{Ca}$ ,  $^{50}\text{Ti}$ ,  $^{54}\text{Cr}$ , etc) with Pb or Bi targets

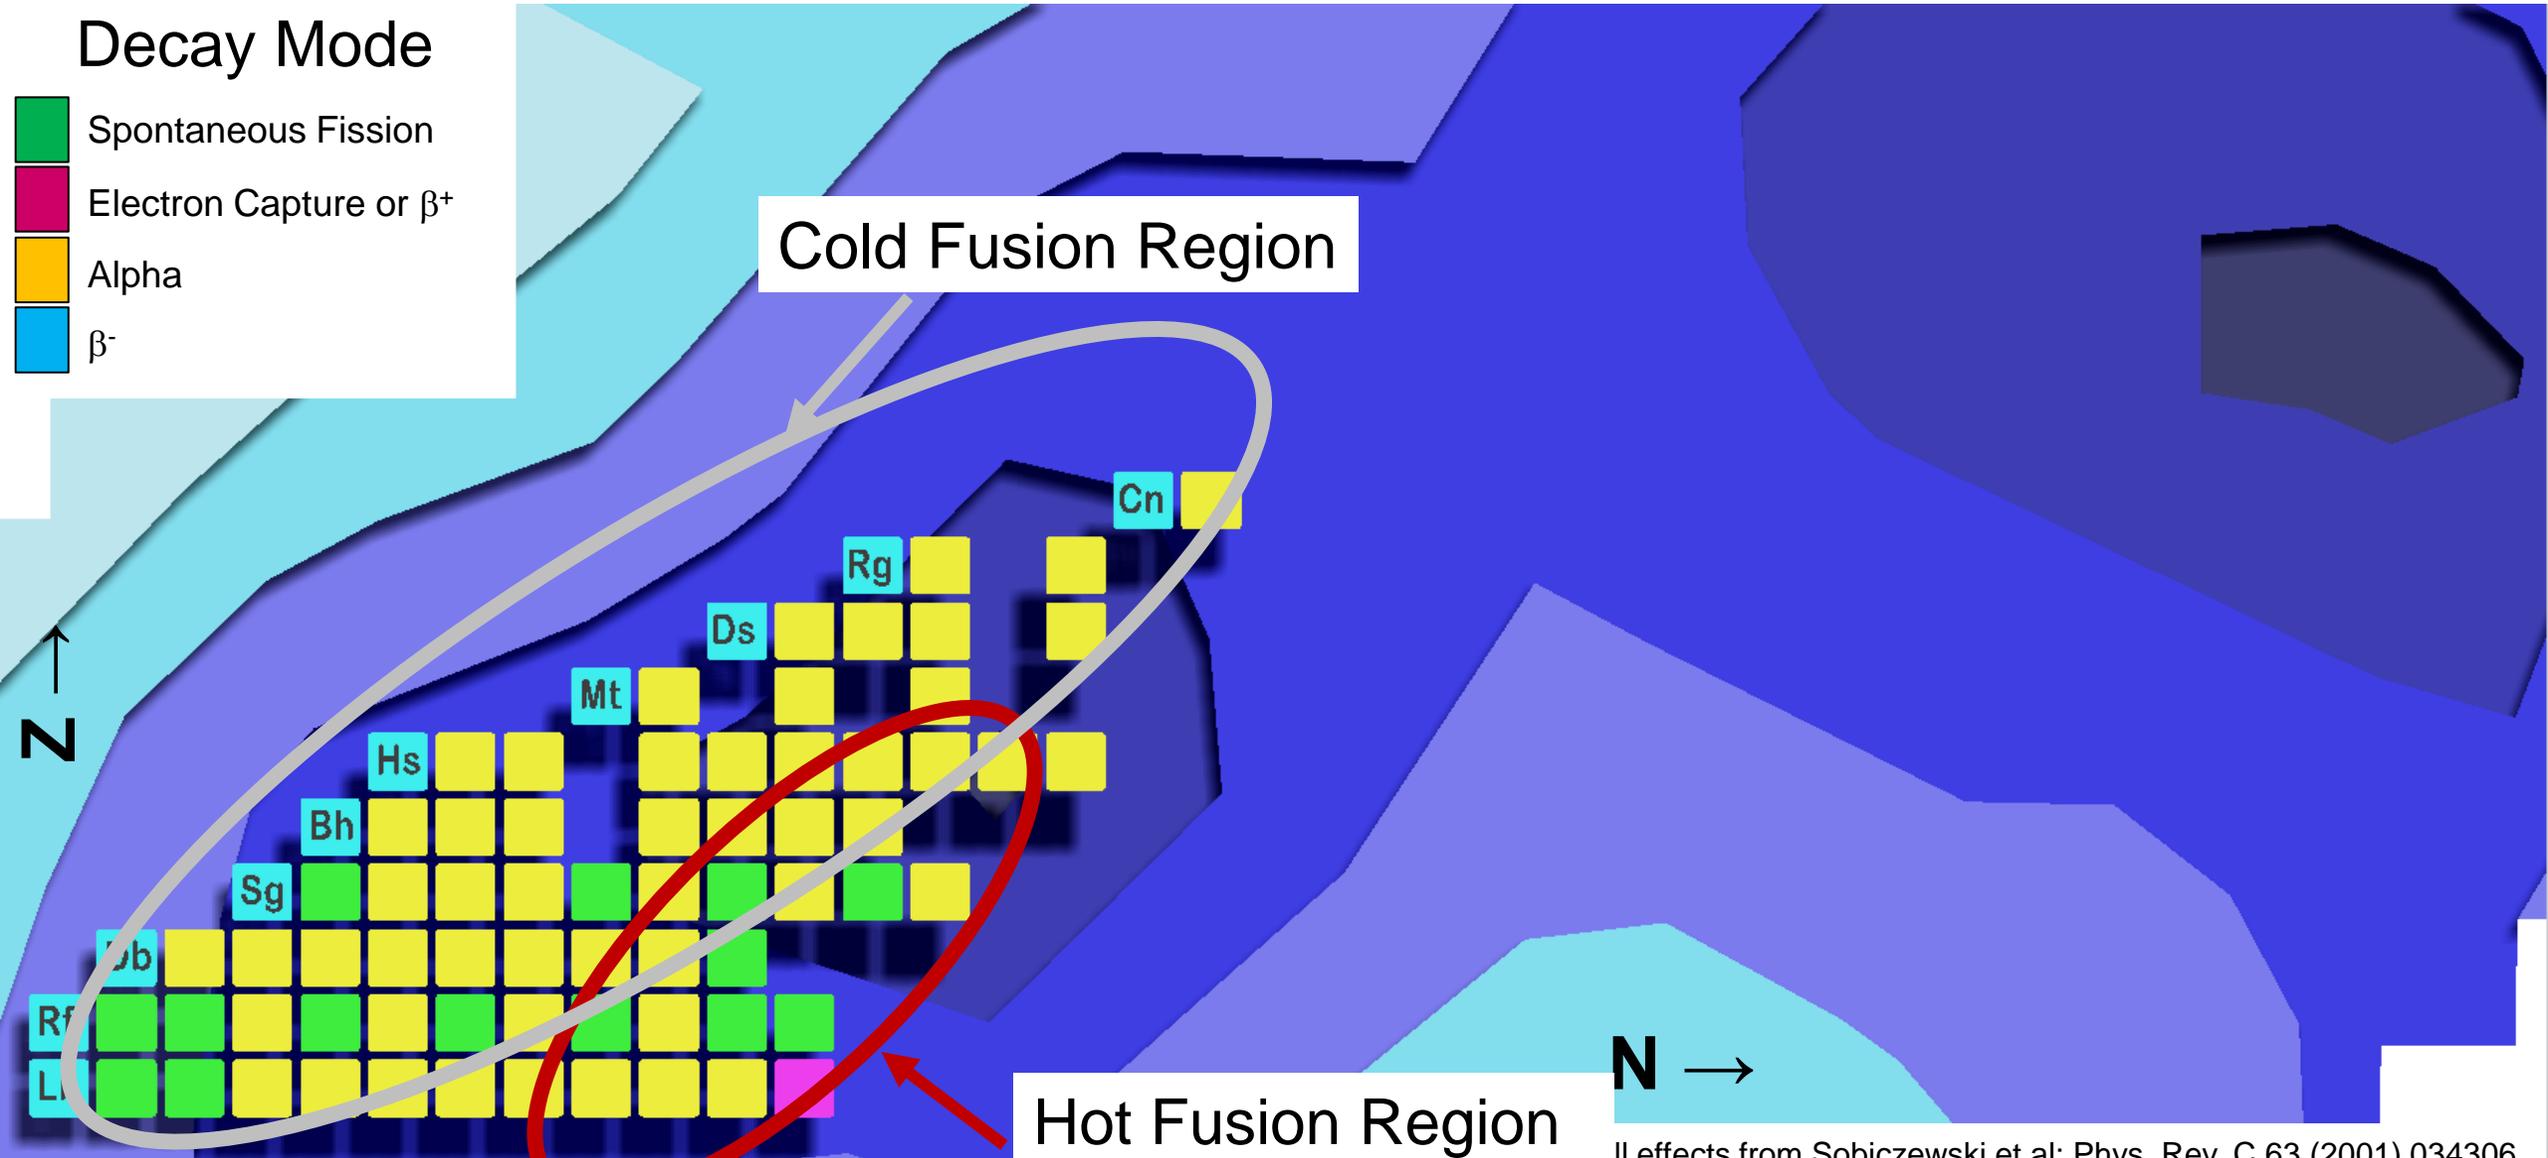

Bass barrier  $\approx 225 \text{ MeV } E_{\text{cm}}$

$E^* \approx 10 \text{ MeV}$

# Chart of the Nuclides: 2000

## Decay Mode

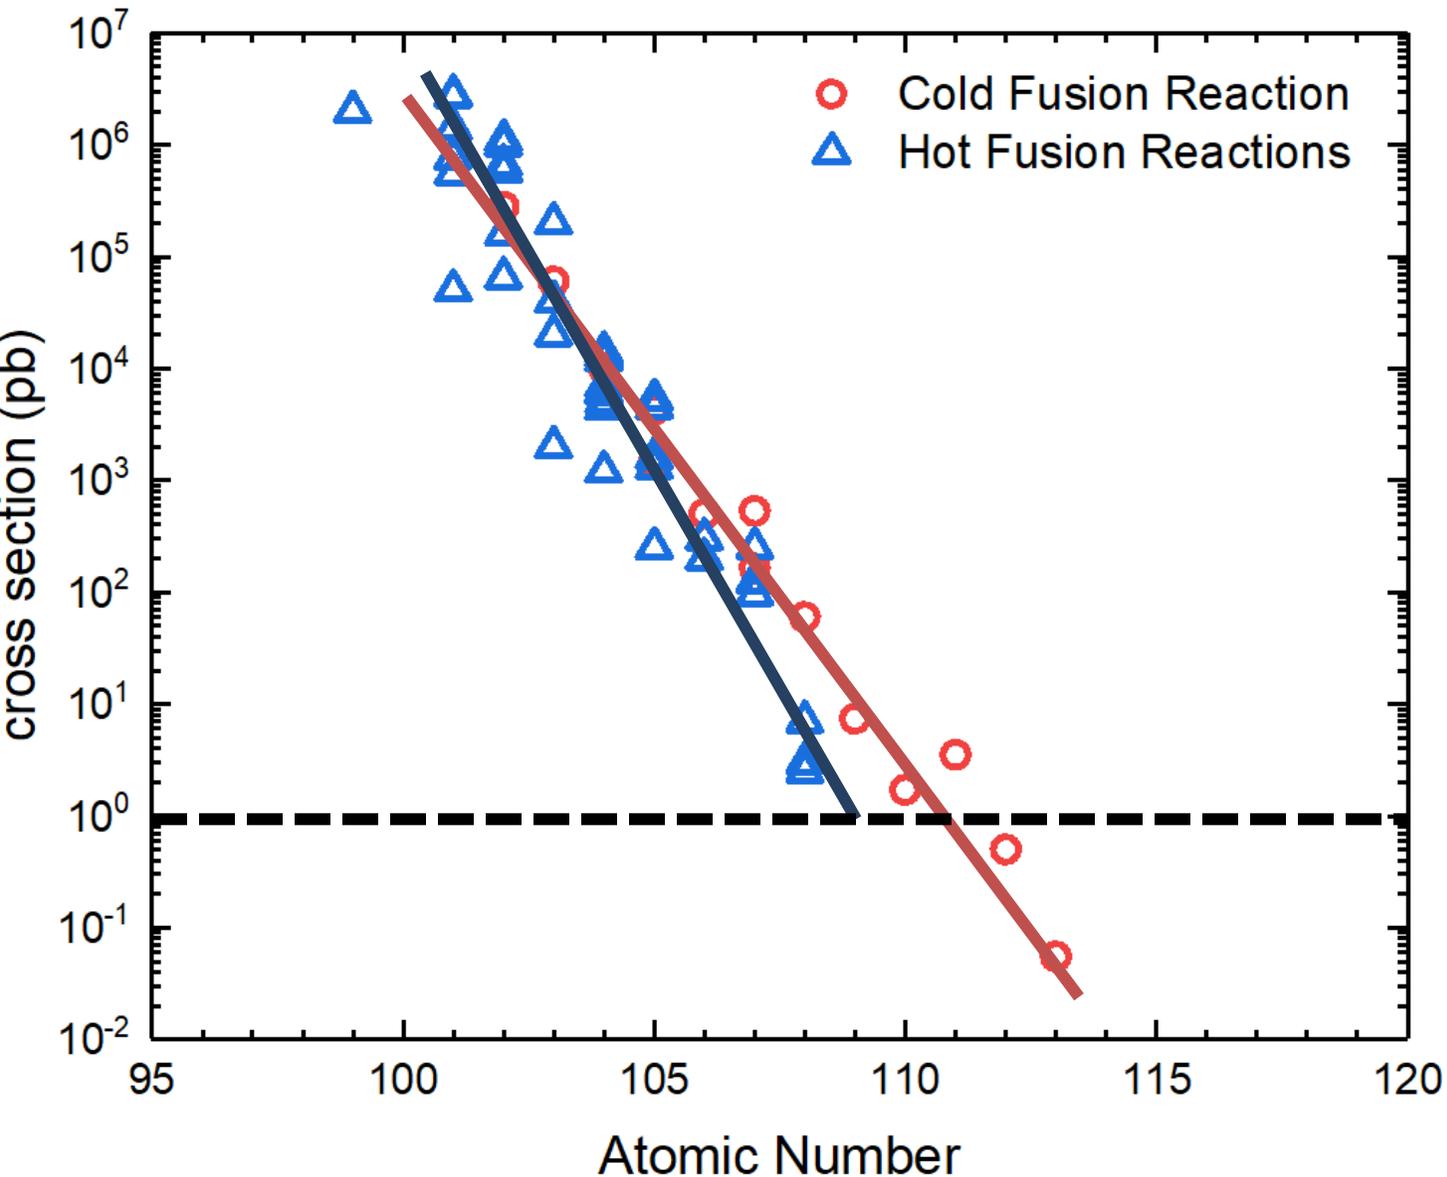

- Spontaneous Fission
- Electron Capture or  $\beta^+$
- Alpha
- $\beta^-$

Il effects from Sobiczewski et al: Phys. Rev. C 63 (2001) 034306

# Discovery of Elements: Pre 2000

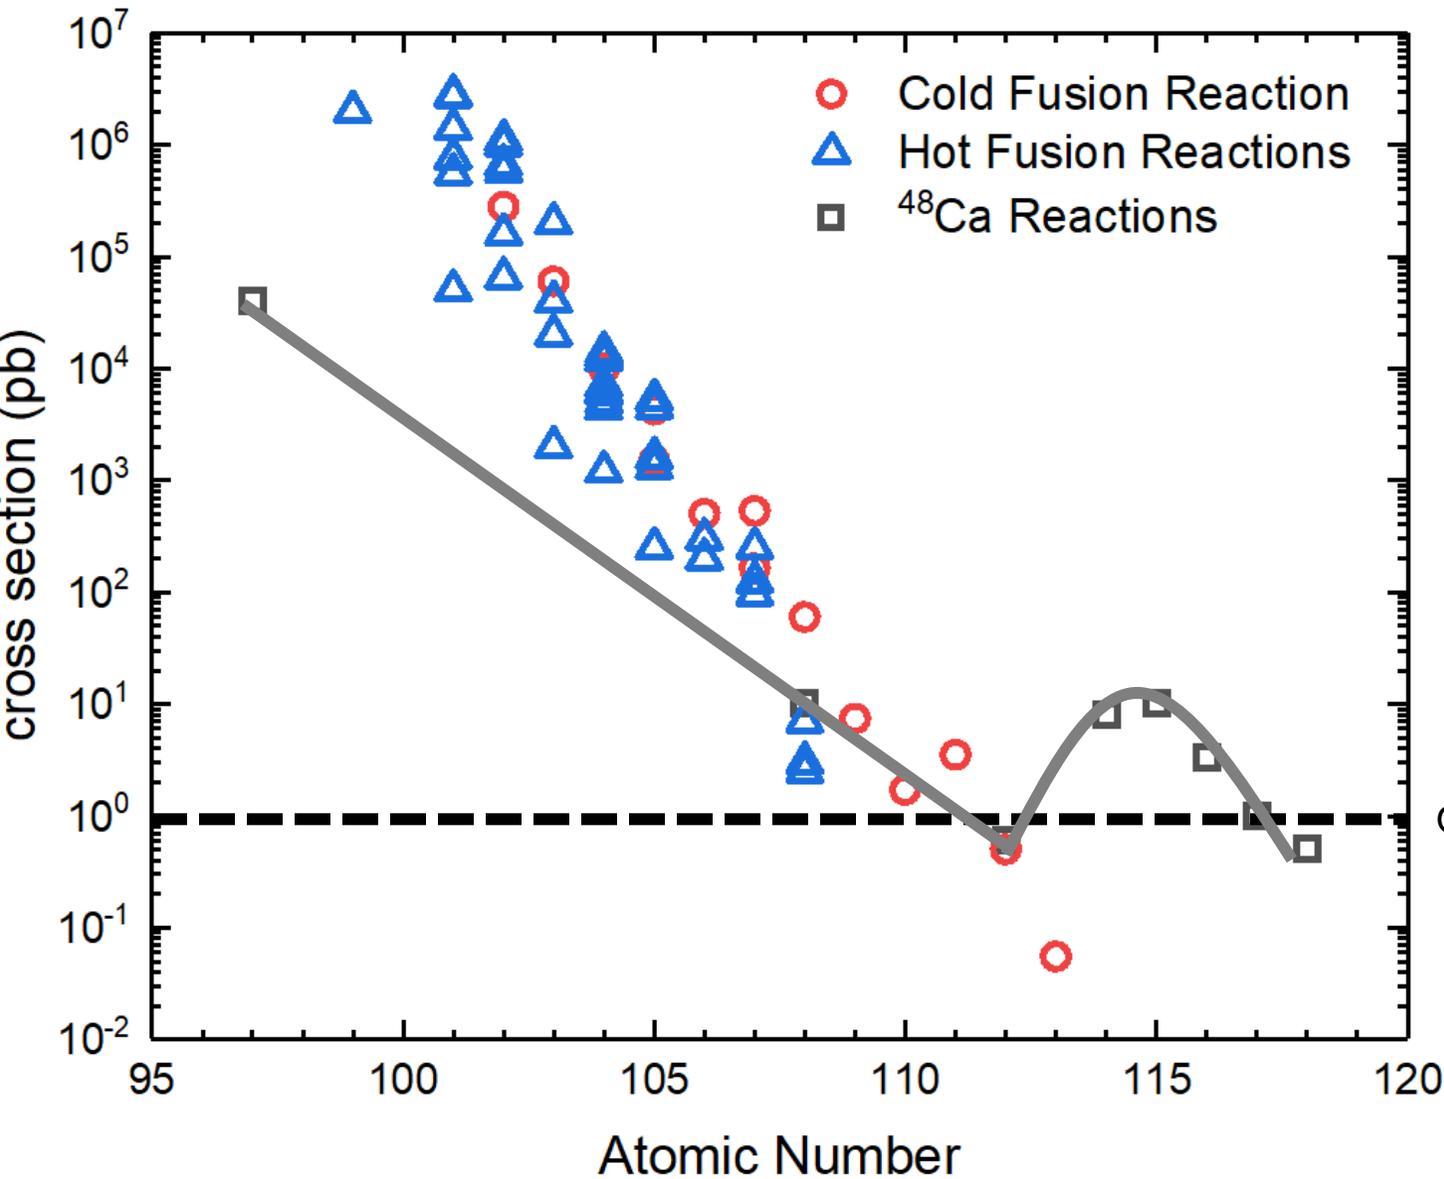

Two main types of reactions used for heavy element synthesis:

- Cold Fusion: transition metals (Ti-Zn) on Lead and Bismuth targets
- Hot Fusion: light ions (O-Ar) on actinide targets

One atom per week

# Discovery of Elements 2000-2010

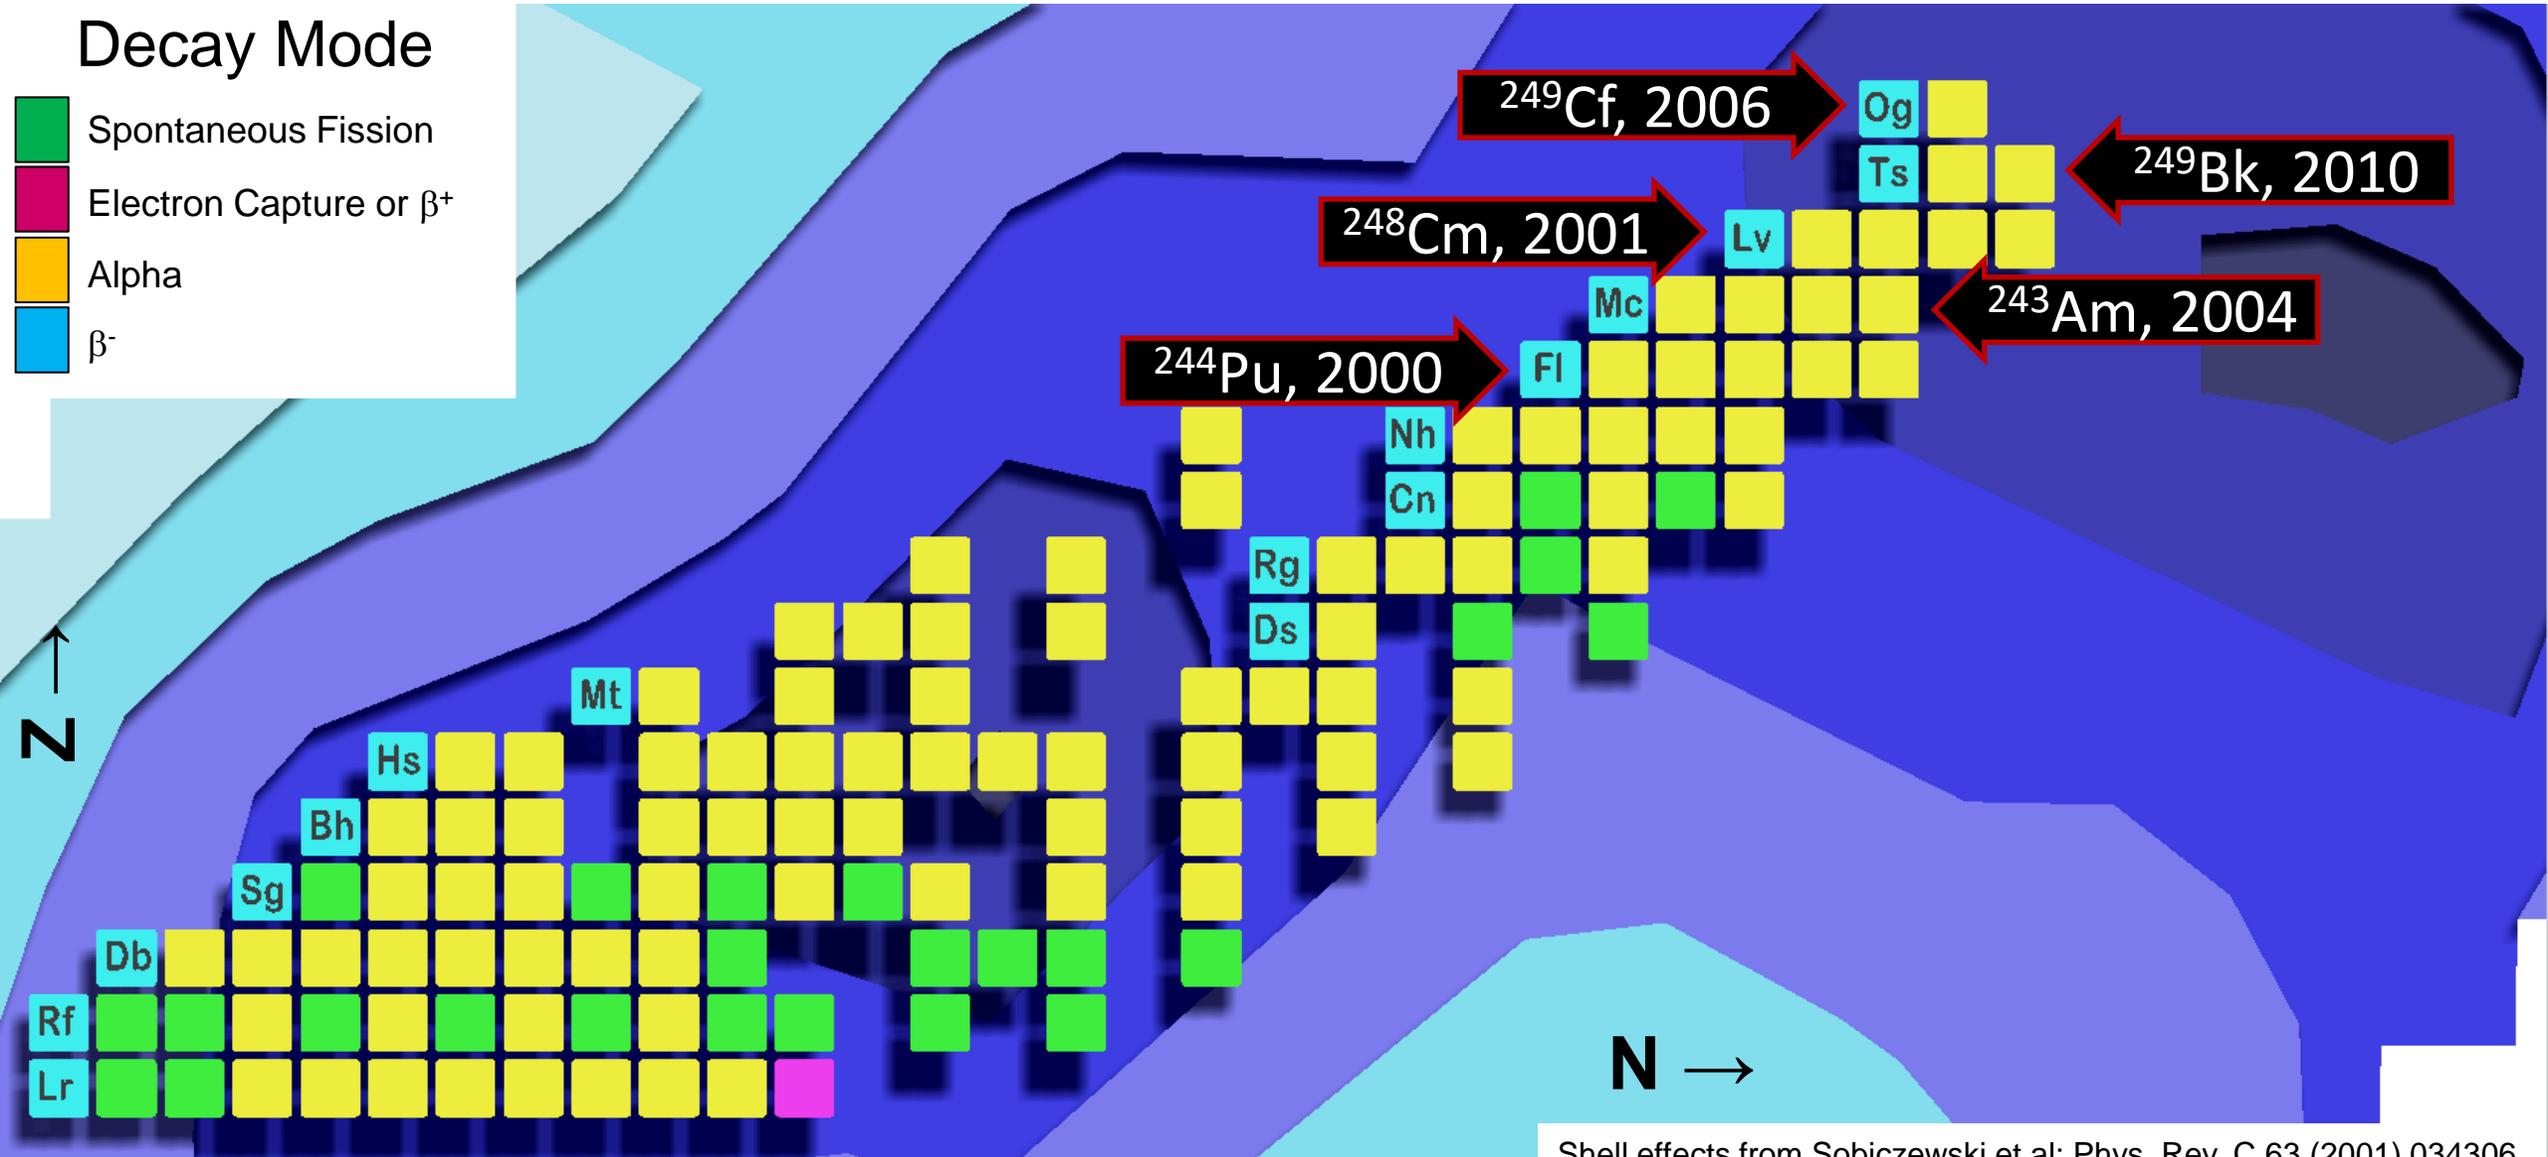

## Superheavy Elements from $^{48}\text{Ca}$ +Actinide targets:

- Cross sections increase with  $E114 > E112 > E110$
- Cross sections peaked  $Z \sim 114-115$

# Chart of the Nuclides: 2019

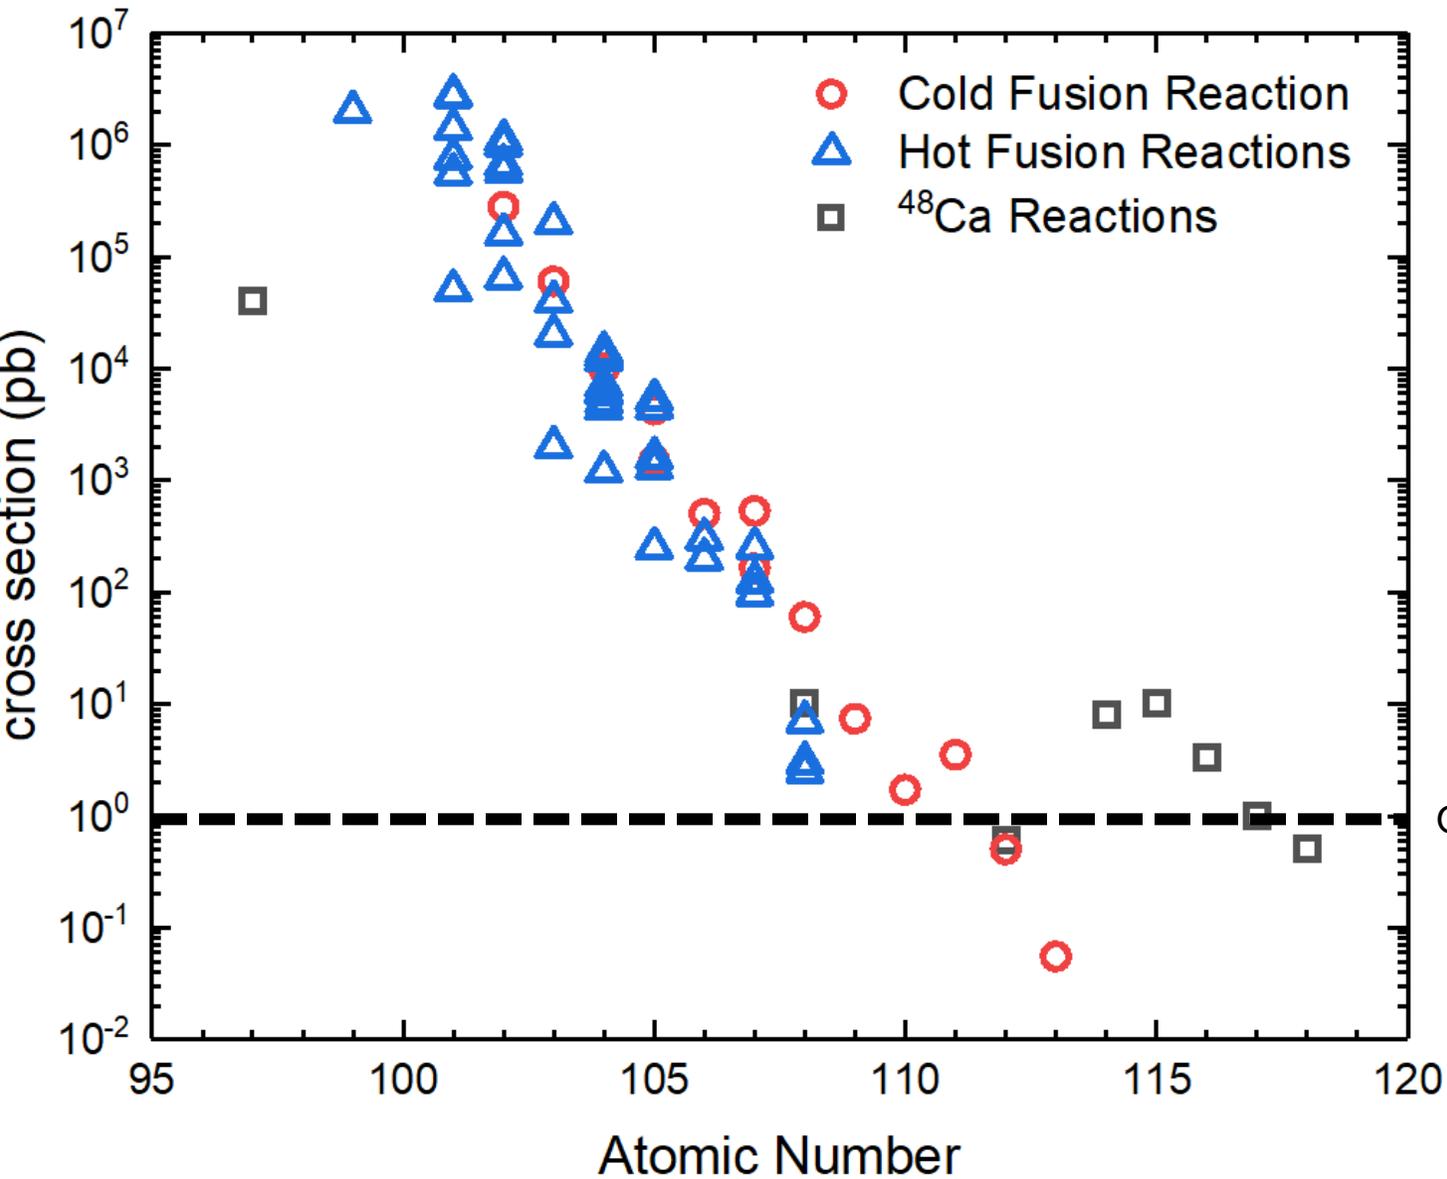

## Decay Mode

- Spontaneous Fission
- Electron Capture or  $\beta^+$
- Alpha
- $\beta^-$

Shell effects from Sobiczewski et al: Phys. Rev. C 63 (2001) 034306

# Discovery of Elements: Post 2010

All reaction mechanisms → cross sections dropping for new discoveries

# Option 1: Change Beam

Heaviest available target material: Californium

$^{249}\text{Es}$ 1.7 hr	$^{250}\text{Es}$ 8.6 hr	$^{251}\text{Es}$ 33 hr	$^{252}\text{Es}$ 472 d	$^{253}\text{Es}$ 20 d	$^{254}\text{Es}$ 275 d	
$^{248}\text{Cf}$ 333 d	$^{249}\text{Cf}$ 350 yr	$^{250}\text{Cf}$ 13 yr	$^{251}\text{Cf}$ 898 yr	$^{252}\text{Cf}$ 2.6 yr	$^{253}\text{Cf}$ 17.8 d	$^{254}\text{Cf}$ 60 d

$^{48}\text{Ca} + \text{Cf} = \text{Element 118}$

**Question: How can we make elements heavier than E118?**

E119 or E120 → Switch to  $^{50}\text{Ti}$  beam (or higher  $Z$ )

**Question: What  
does that do to the  
cross section?**

# Experimental Attempts $Z > 118$

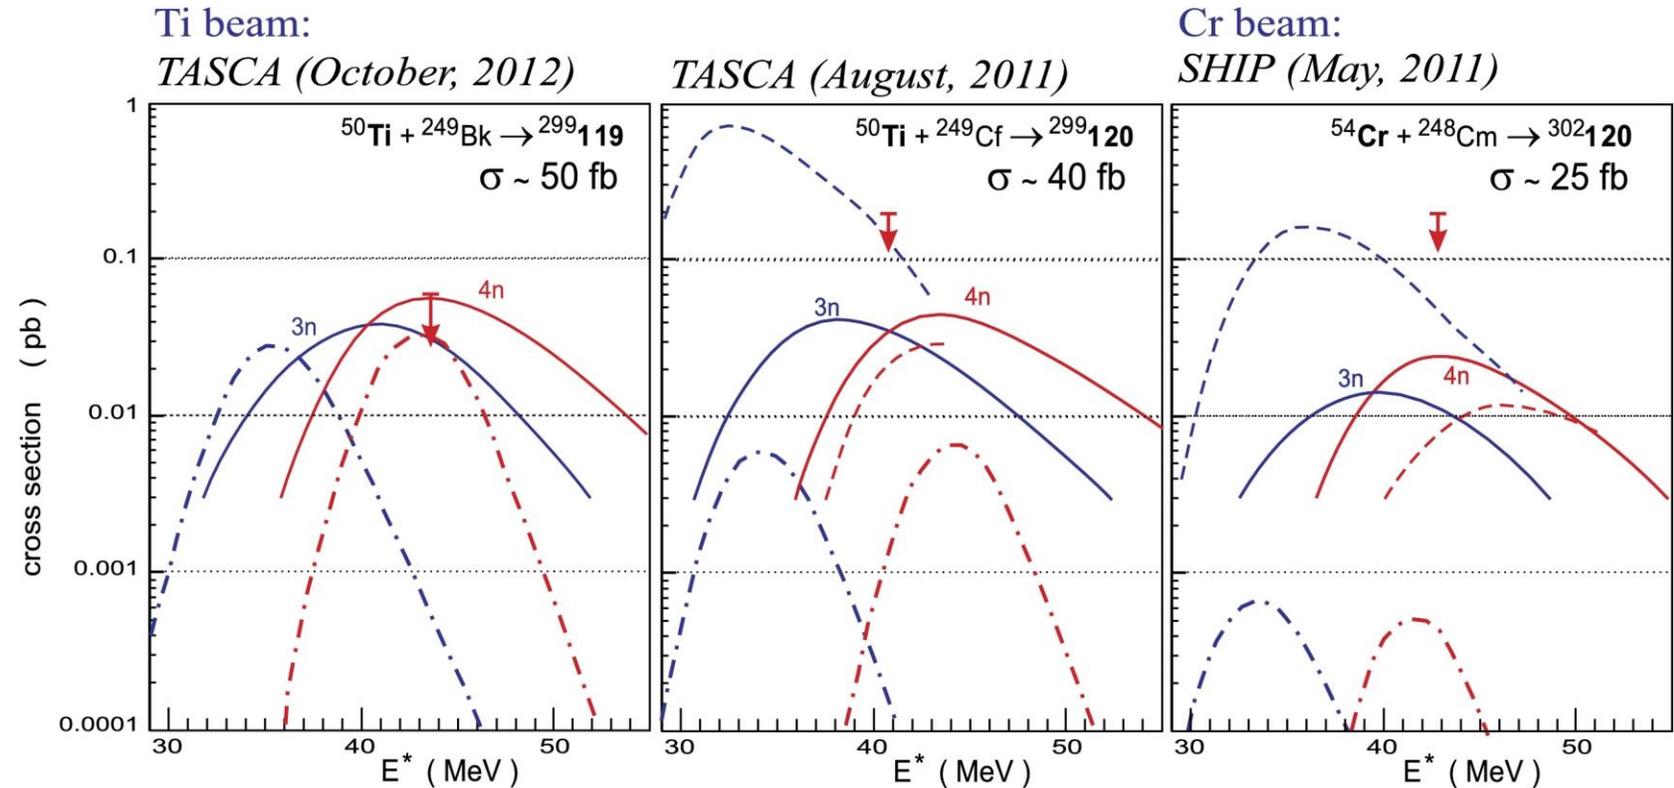

Multiple attempts have been made to push towards heavier elements

Most have not pushed much past cross sections observed with  $^{48}\text{Ca} + \text{Actinides}$

Beam	Target	CN	xn	Cross section	Separator	Ref.

# $^{50}\text{Ti}$ Beams

Theoretical predictions say  $^{50}\text{Ti}$  beams  $\sim 10\times$  lower cross section than  $^{48}\text{Ca}$  beams

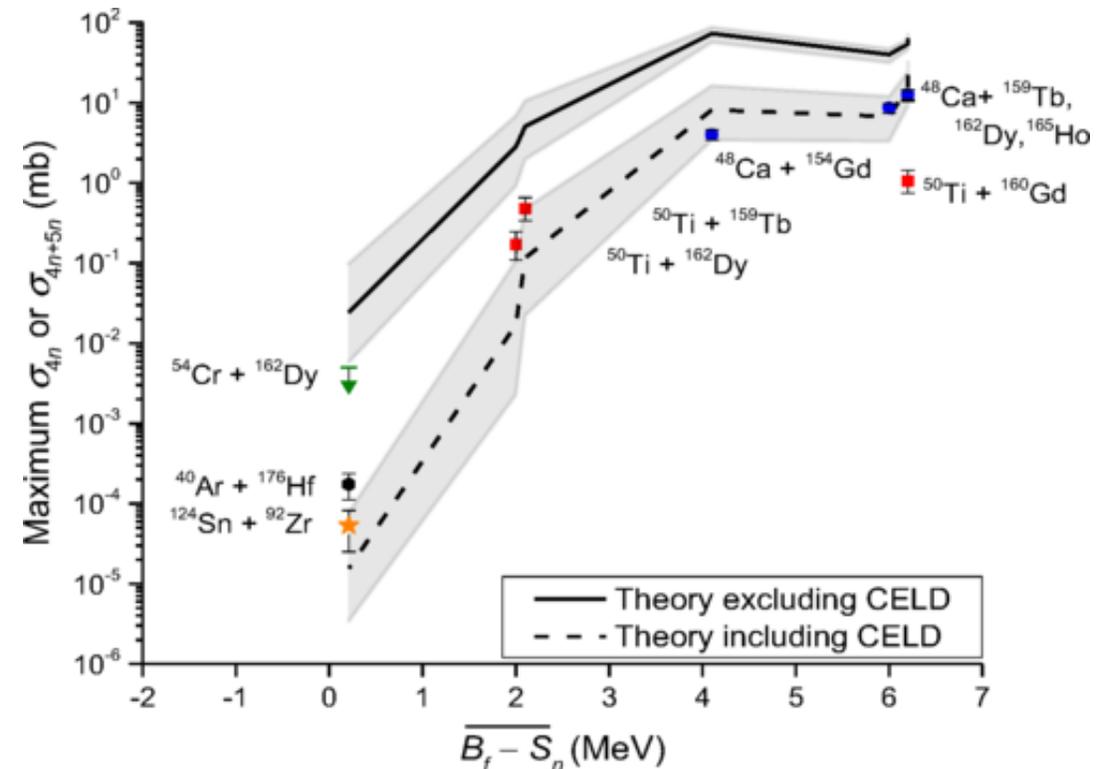

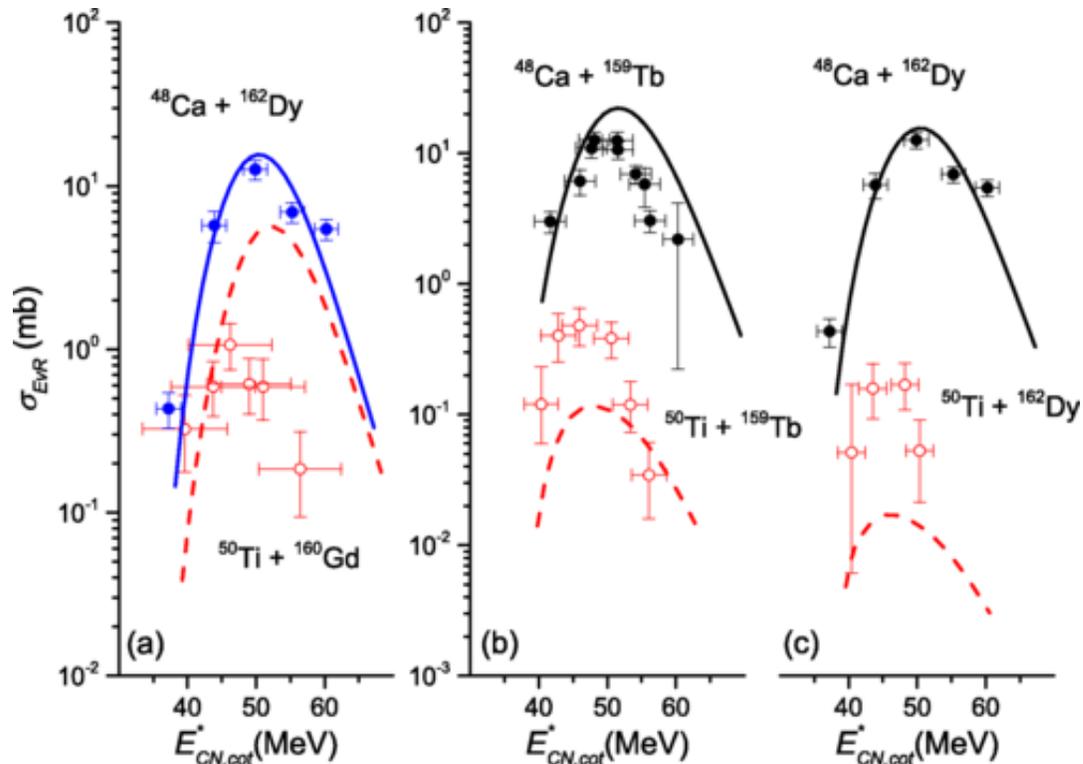

Cross section predictions for production of E119, E120 with  $^{50}\text{Ti}$  and  $^{54}\text{Cr}$

Zagrebaev, V.I. Nucl. Phys. A **944** (2015) 275: <https://doi.org/10.1016/j.nuclphysa.2015.02.010>

# $^{50}\text{Ti}$ Beams

What does experiment say?

- No one has measured  $^{48}\text{Ca}$  vs  $^{50}\text{Ti}$  superheavy element cross sections
- Test case:  $^{48}\text{Ca}, ^{50}\text{Ti}$  on lanthanide targets  $\rightarrow$  lose x10

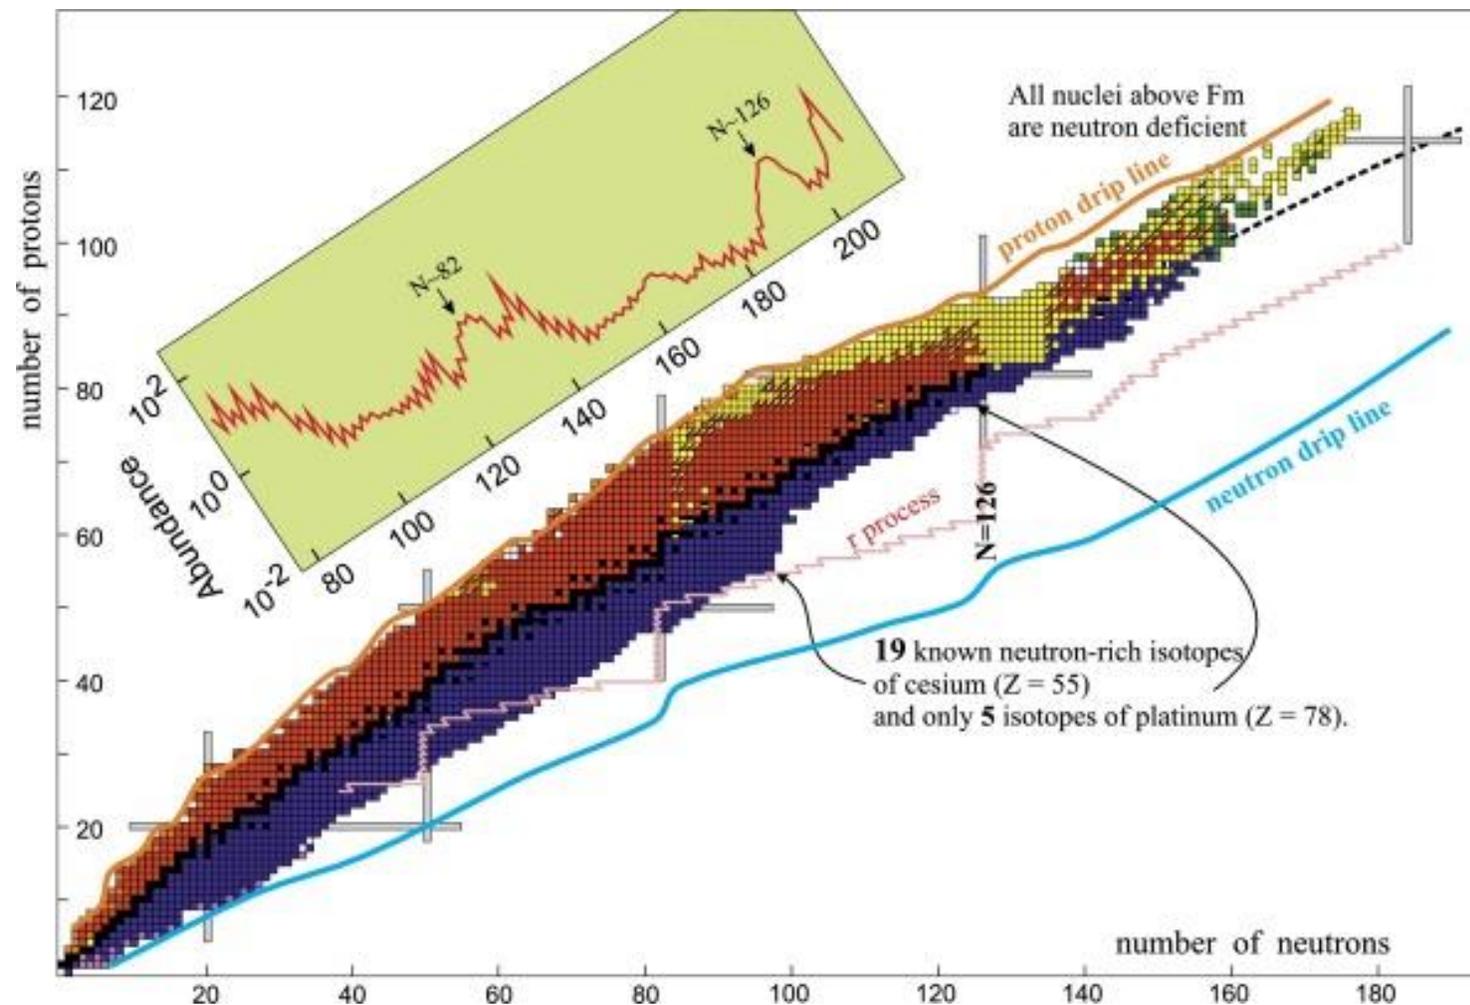

Mayorov, D.A. Phys. Rev. C **92** (2015) 054601: <https://doi.org/10.1103/PhysRevC.92.054601>

All known superheavy elements lie north of the line of beta stability and are approaching the proton-drip line

Compound nucleus reactions → limited (no) opportunities to increase neutron number

Can multinucleon transfer reactions push towards more n-rich isotopes and heavier elements?

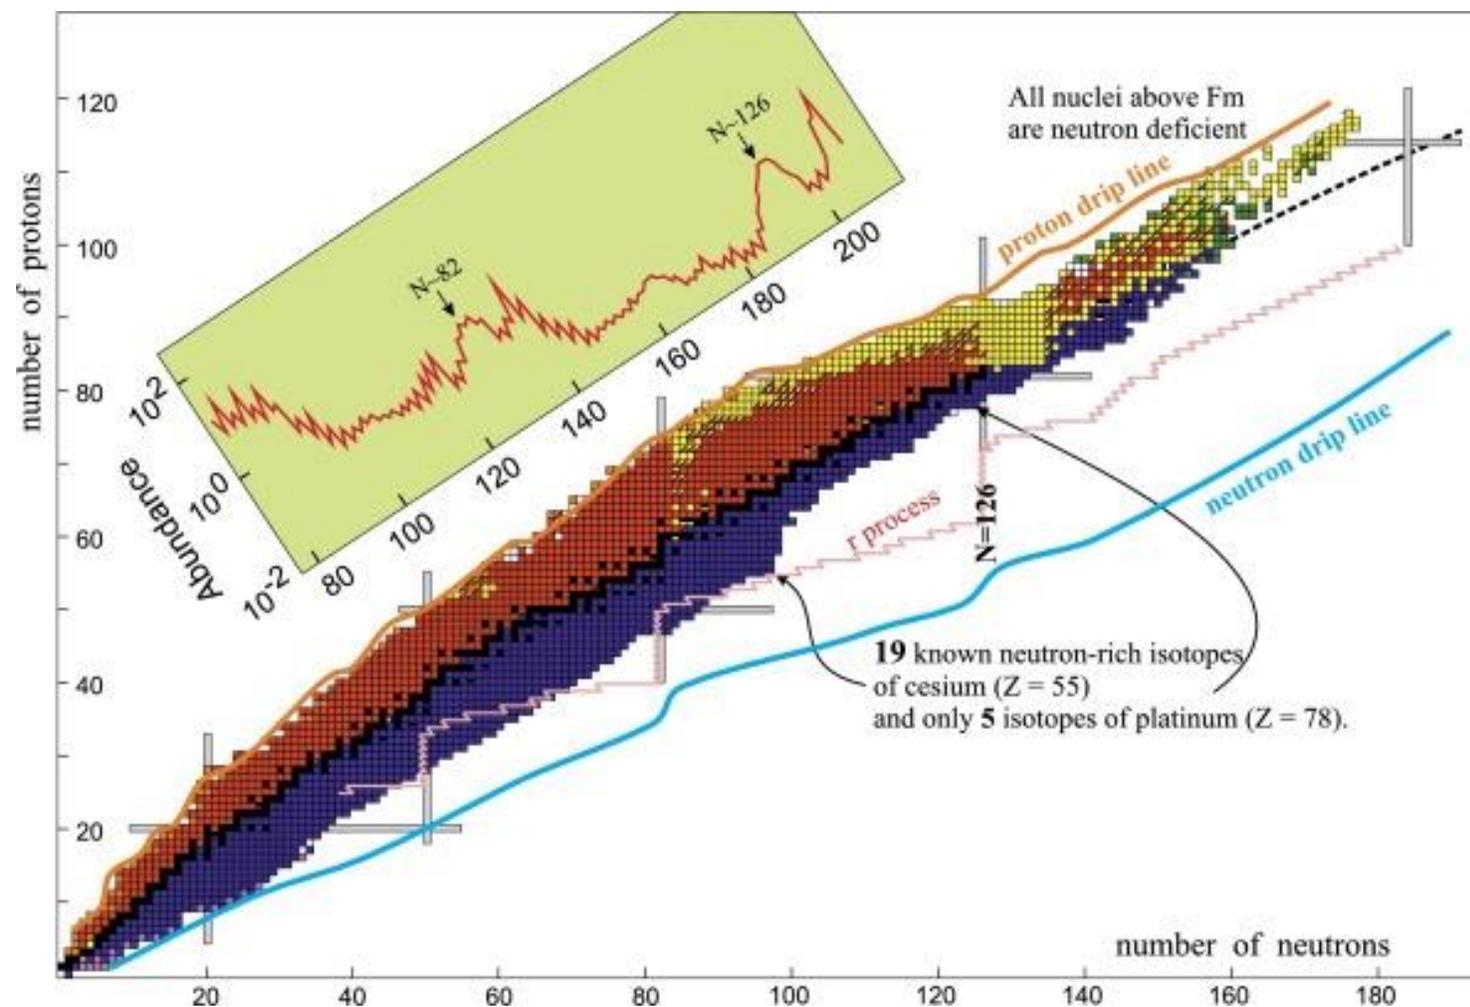

Zagrebaev, V.I. Nucl. Phys. A **944** (2015) 275: <https://doi.org/10.1016/j.nuclphysa.2015.02.010>

**Question:** Are there other ways of making SHE beyond compound-nucleus reactions?

All known superheavy elements lie north of the line of beta stability and are approaching the proton-drip line

Compound nucleus reactions → limited (no) opportunities to increase neutron number

Can multinucleon transfer reactions push towards more n-rich isotopes and heavier elements?

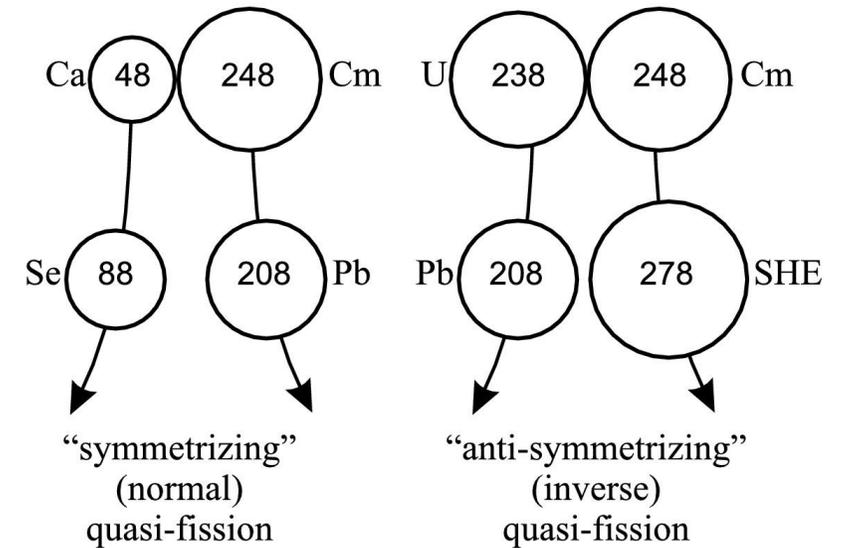

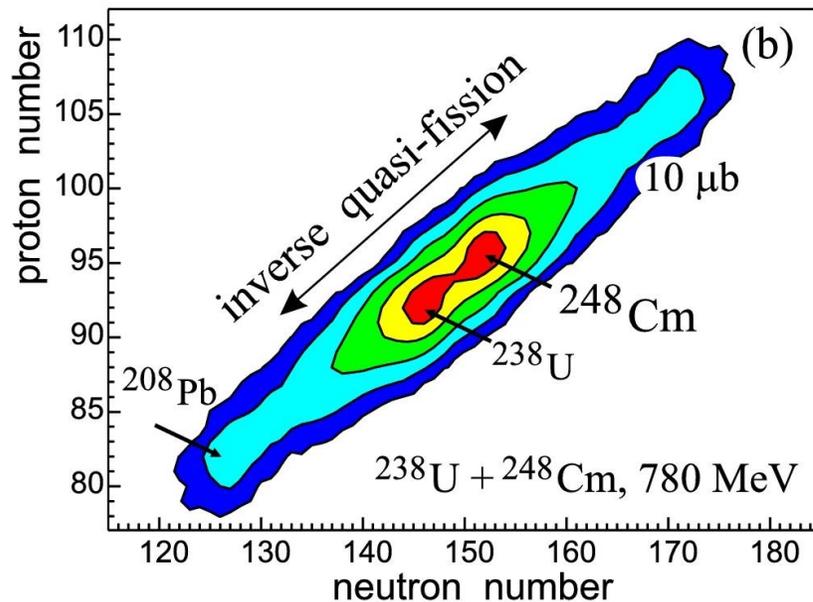

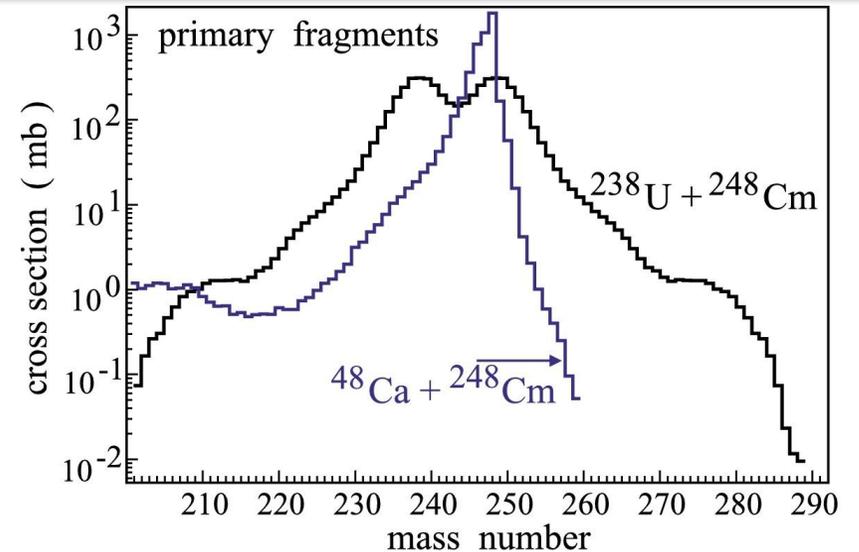

Zagrebaev, V.I. Nucl. Phys. A **944** (2015) 275: <https://doi.org/10.1016/j.nuclphysa.2015.02.010>

# Multinucleon Transfer Reactions

Can multinucleon transfer reactions push towards more n-rich isotopes and heavier elements?

Theoretical predictions of MNT from two different systems

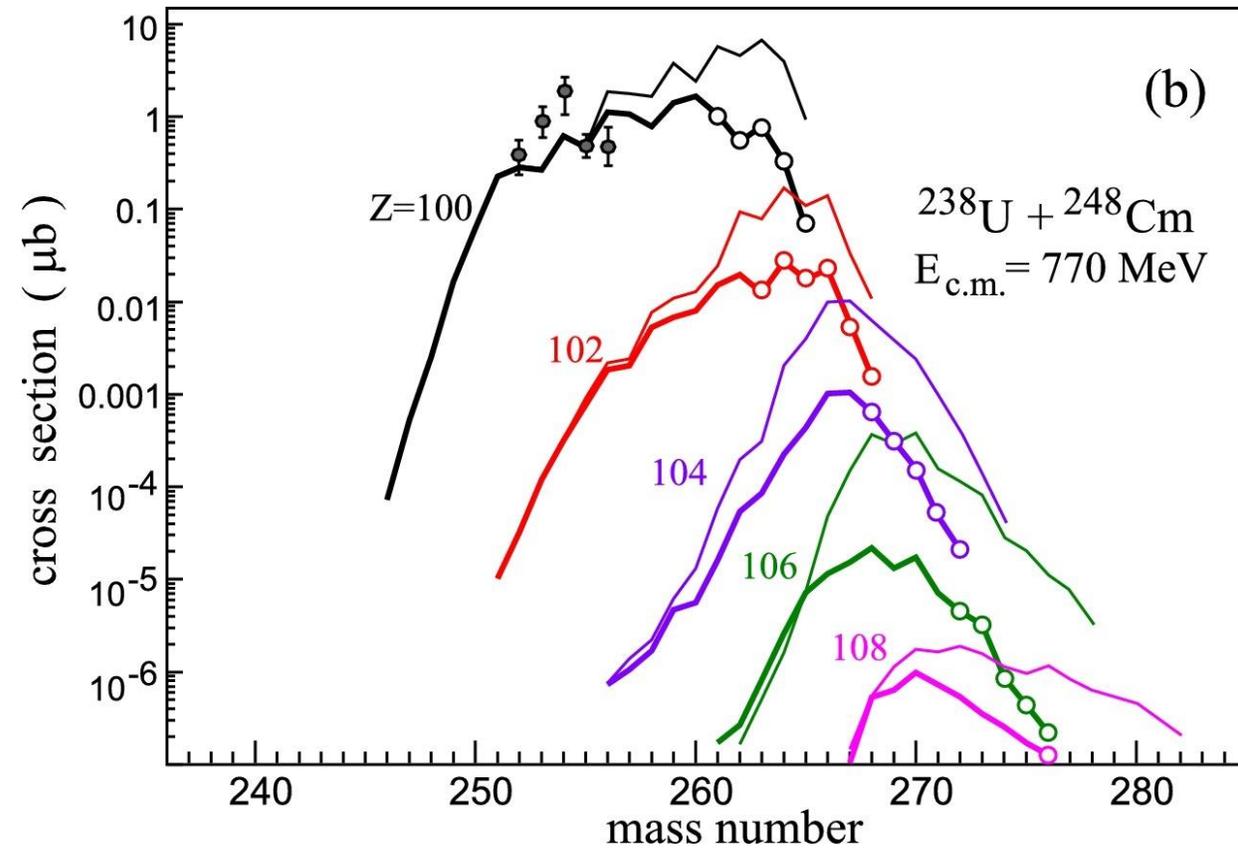

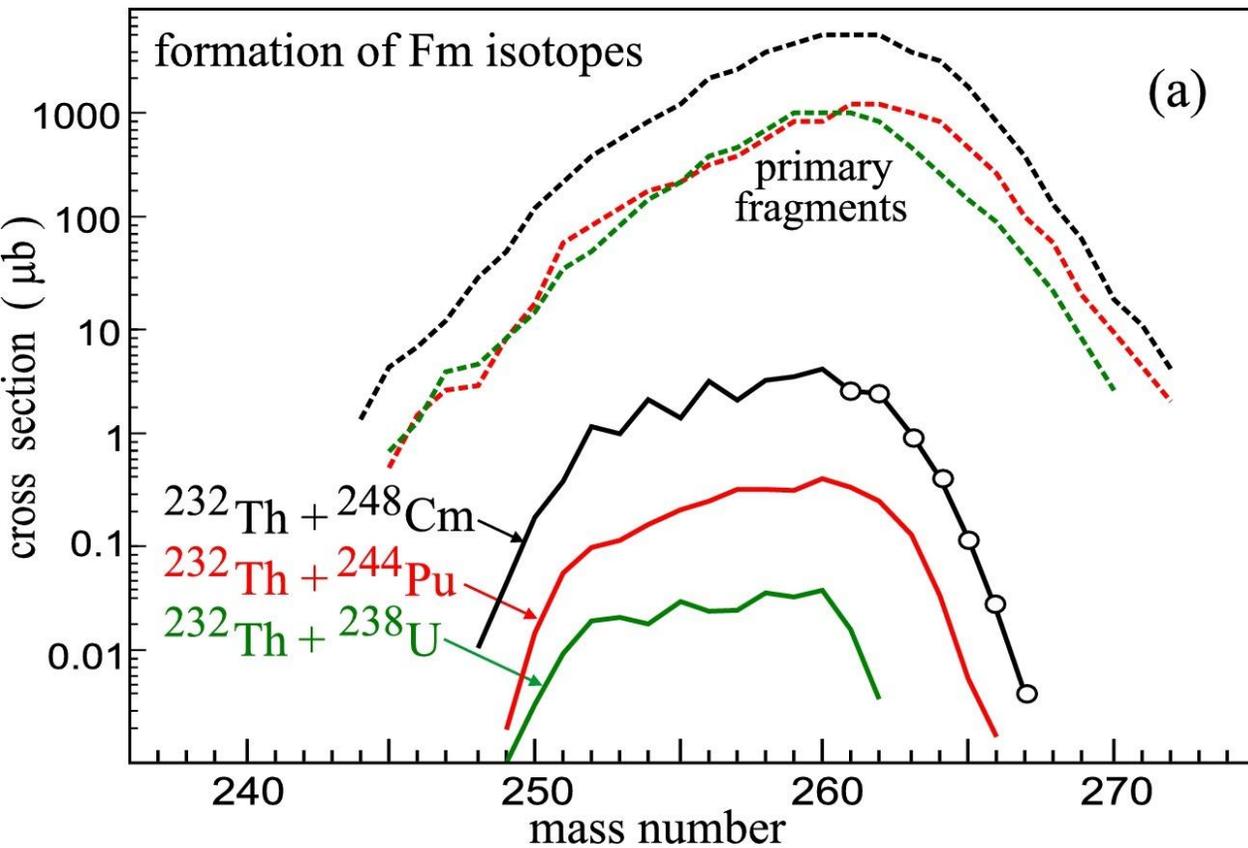

Zagrebaev, V.I. Nucl. Phys. A **944** (2015) 275: <https://doi.org/10.1016/j.nuclphysa.2015.02.010>

# Multinucleon Transfer Reactions

Theoretical isotopic yields of fermium nuclei in collisions of  $^{232}\text{Th}$  with  $^{238}\text{U}$ ,  $^{244}\text{Pu}$  and  $^{248}\text{Cm}$

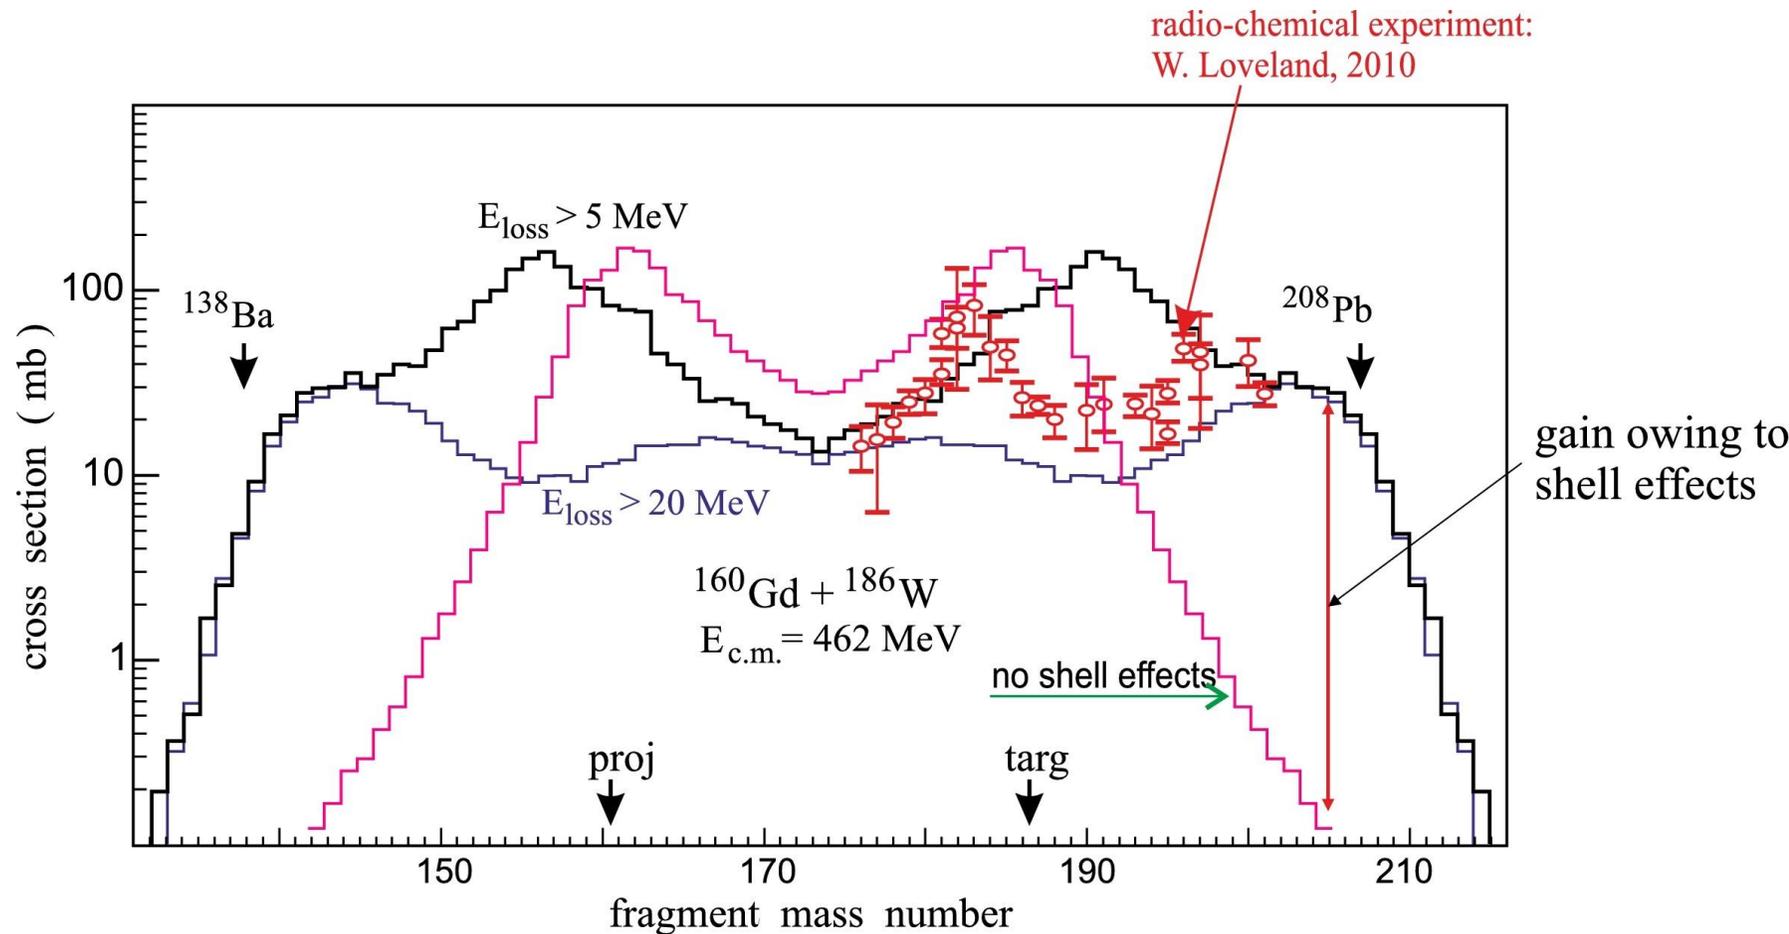

- Difficult experimentally: n-rich  $\rightarrow$  beta decay

Zagrebaev, V.I. Nucl. Phys. A **944** (2015) 275: <https://doi.org/10.1016/j.nuclphysa.2015.02.010>
