Chip traps

Loading the Trap

In order to load an ion trap we must:

- 1 Heat the barium oven
- 2 Ionize a barium atom
- 3 Cool the ion

Loading the Trap

In order to load an ion trap we must:

- 1 Heat the barium oven
- 2 Ionize a barium atom
- 3 Cool the ion

Loading the Trap

In order to load an ion trap we must:

- 1 Heat the barium oven
- 2 Ionize a barium atom
- 3 Cool the ion

Loading the Trap

In order to load an ion trap we must:

- 1 Heat the barium oven
- 2 Ionize a barium atom
- 3 Cool the ion

Problem

- Barium atoms are not making it into the chip trap
- The hole that the atoms should be traveling through is blocked
- The oven is producing large barium chunks while it heats up. These chunks block the hole and prevent any trapping.

Movable Shield

- Actuated using a bimetal strip

Movable Shield

- Actuated using a bimetal strip
- Tested in vacuum

Detecting the Ions

Detecting the Ions

- PMTs detect photons emitted by the ions

Detecting the Ions

- PMTs detect photons emitted by the ions

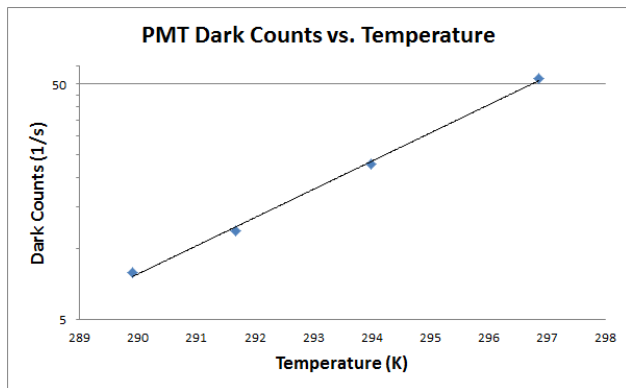

Detecting the Ions

- PMTs detect photons emitted by the ions
- For entanglement experiments, we want to be able to detect single emitted photons
 - Therefore, we need a very high sensitivity and a very low noise level

Lowering the noise level

- Dark counts are false positive readings from the PMT
- They constitute a significant fraction of our noise level

Improvements to ion trapping system:

- Movable shield
 - Prevents blockage of the hole that allows ions into the trap
 - Allows repeated re-loading of trap
- Lowered noise from PMT

Acknowledgements

Thank you to:

- Boris Blinov for being my advisor
- Tom, Carolyn, Matt, Spencer, John, Tomasz and the rest of the Trapped Ion Quantum Computing Group for helping me with my project and teaching me so much about theirs
- Emma, Rachel, Emily, Hunter, Eli, Scott and Jarret for being awesome people to spend my summer with
- Deep, Alejandro, Linda and Janine for organizing the REU program and making this all possible

Questions?
