Background

UNIVERSITY *of* WASHINGTON

Neutrino Mass

- Standard Model predicts no mass
- Observed oscillations require a superposition of mass eigenstates
- There is a difference between these masses, so they cannot all be zero
- The mass is still at least 10^6 times smaller than an electron

Direct Measurement of Neutrino Mass with Electron Beta Decay

- Tritium beta decays into
 - Helium-3
 - Electron
 - Electron anti-neutrino
- The electron energy spectrum is affected by neutrino mass

$$\frac{dN}{dE} = C \cdot F(E, Z) \cdot P \cdot (E + m_e) \cdot (E_0 - E) \sqrt{(E_0 - E)^2 - m_\beta^2}$$

(some details/corrections not included here)

Neutrino mass

High Pass Electron Energy Filter

- Clear decrease in electron energy, depending on neutrino mass
- Electric potential in the main spectrometer selects electron energies higher than a certain threshold
- Detector resolution is relevant in eliminating noise

Audrey Cole

UNIVERSITY of WASHINGTON

Ubierto Diaz, Marta. (2011). Off-line commissioning of a non-destructive FT-ICR detection system for monitoring the ion concentration in the KATRIN beamline.

Karlsruhe Tritium Neutrino (KATRIN) Experiment

- Tritium source undergoes beta decay
- Main spectrometer imposes high pass filter
- Segmented detector detects beta electrons
- Upper limit of 0.8 eV at 90% Confidence Level

KATRIN Detector

- 148-pixel silicon-PIN-diode focal-plane detectors (FPD)
- The mean dead layer, based on previous performance of the KATRIN experiment, is $155.4 \pm 0.5 \pm 0.2 \text{ nm}$

Mounted wafer with unsegmented front side, KATRIN(2023).

Silicon-PIN-Diode Focal-Plane Detectors (FPD)

- Semiconductor
- Reverse biased
- Charge separation
- Ionization of particles passing through the detector
- Creates current, which is recorded

Dead Layer Thickness

UNIVERSITY of WASHINGTON

Experimental Set-Up

UNIVERSITY *of* WASHINGTON

Candidate Detector from LBNL

- Expected dead layer thickness of 35 nm (currently 155.4 nm)
- Aluminum coating to reduce noise
- Thin contacts
- 0.944 cm^2 surface area
- Good candidate!

Source
Pivot Angle Knob

Energy Calibration with an Am-241 Spectrum

- ADC: Analog to Digital Converter
- 59.536 keV peak
- Gamma particles unaffected by dead layer energy loss
- Gaussian broadening due to instrumental noise
- Fitted with a Gaussian

Conversion from ADC to Energy (keV)

- Centered on 59.536 keV/(153.16 \pm 0.08 ADC)
 - 0.05% error
- Conversion factor of:
0.38892 \pm 0.00020 keV/ADC

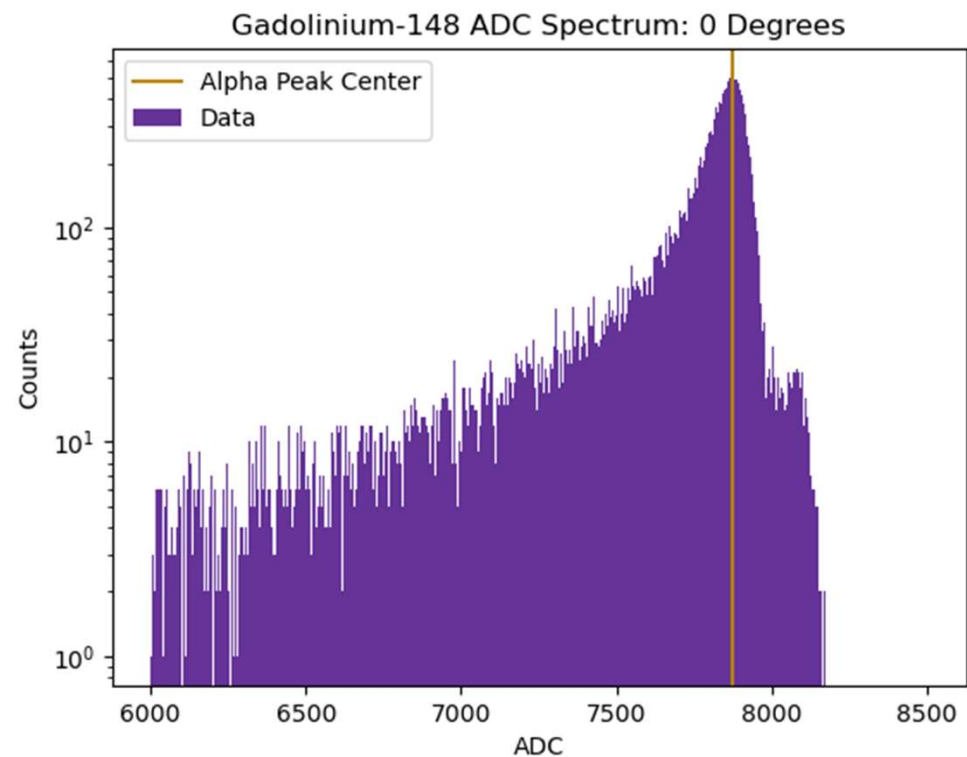

Dead Layer Thickness

UNIVERSITY *of* WASHINGTON

Spectrum of Gd-148 Alpha Source

- Initial energy of an alpha particle emitted from this source: 3182.8 keV
- Alpha particles lose energy in all media
- Useful for calculating dead layer but not calibration
- Gaussian behavior on the right slope
- Exponential energy loss on the left slope

UNIVERSITY of WASHINGTON

Nadine M. Chiera, et al, Determination of the half-life of gadolinium-148, Applied Radiation and Isotopes, Volume 194, 2023, 110708, ISSN 0969-8043, <https://doi.org/10.1016/j.apradiso.2023.110708>.
(<https://www.sciencedirect.com/science/article/pii/S0969804323000611>)

Varying Source Angle

- Z : dead layer thickness
- Θ : angle of the source relative to vertical
- α : emitted alpha particle incident on the detector
- Path length through dead layer: $Z/\cos(\Theta)$
- Robust against absolute energy scale errors and dE/dx low energy uncertainty

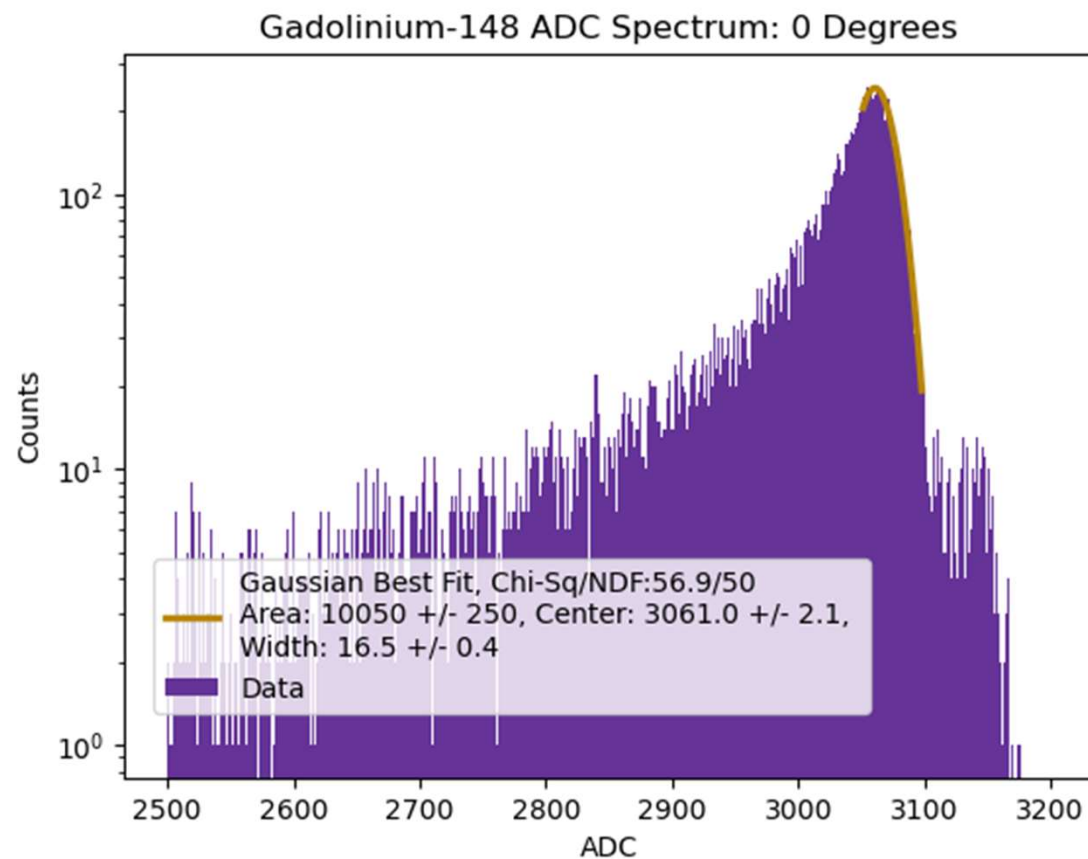

Fitting a Gaussian to the Right Side

- Manually choose the Gaussian portion of the histogram
- Assess the quality of fit
- Record the center peak energy for each source angle
- Note: center position error impacted by conversion factor error

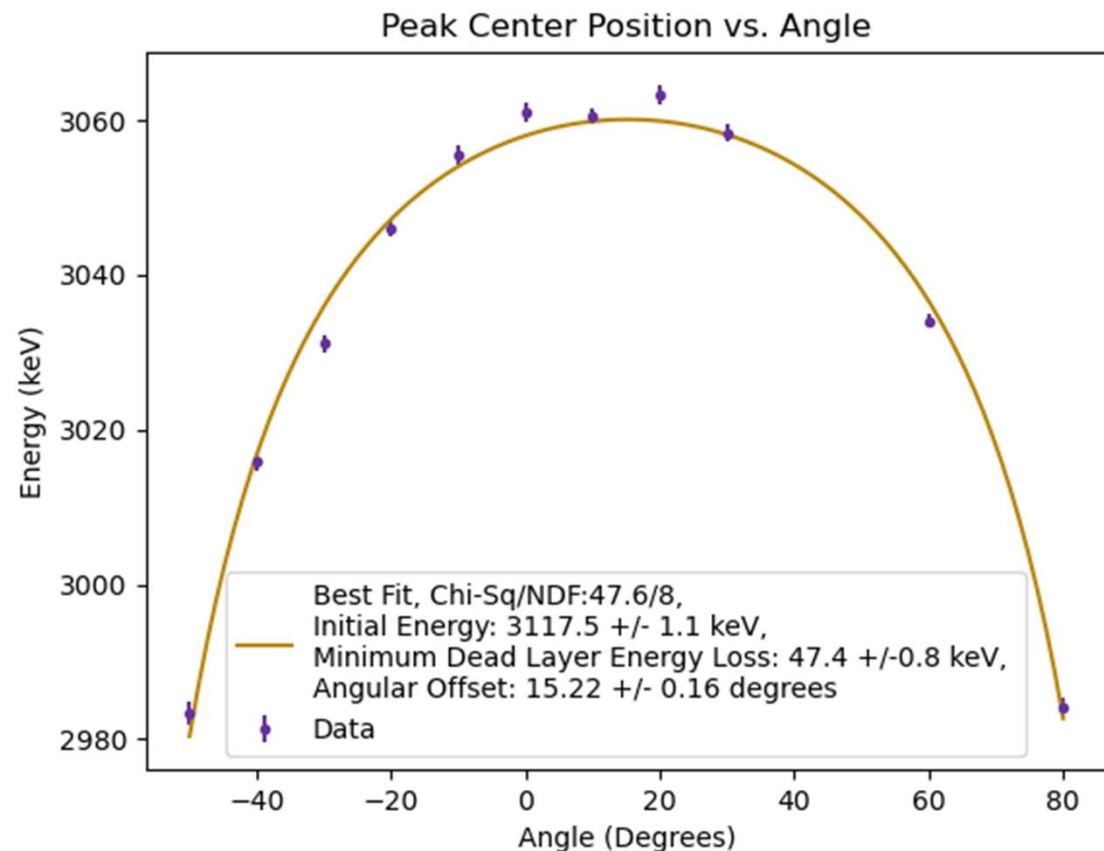

20

Audrey Cole

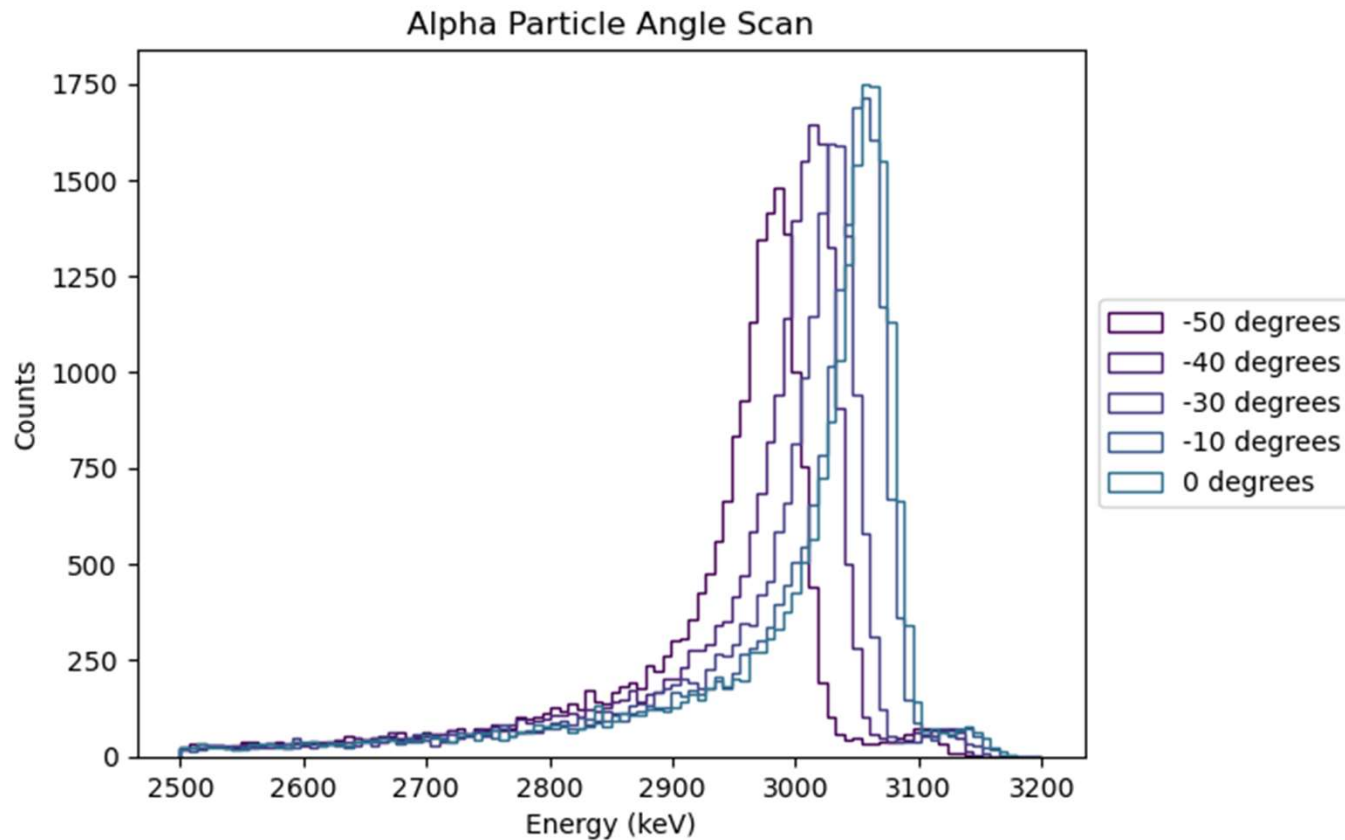

Results of Alpha Peak

- Fitted to $y = a - \frac{b}{\cos(x-c)}$
- Minimum Dead Layer Energy Loss: 57.4 +/- 0.8 keV
- Energy loss coefficient for alpha particles in silicon: 170 +/- 10 keV/micrometer
- Dead layer thickness: 338 +/- 25 nm

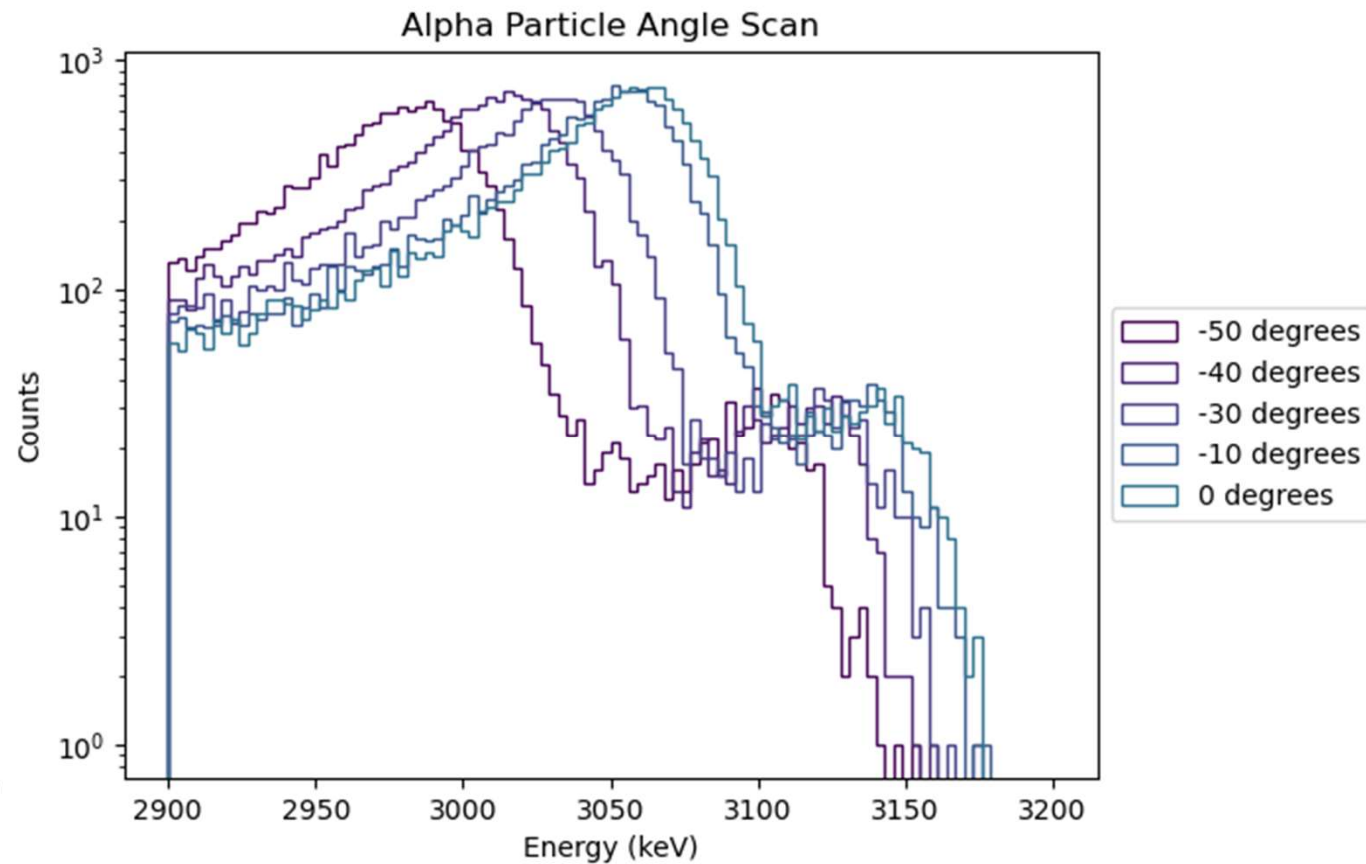

Angular Displacement Effect on Gd-148 Spectrum

- Decreasing angular displacement
- Decreases path length through the dead layer
- Shifts energy peaks to the right

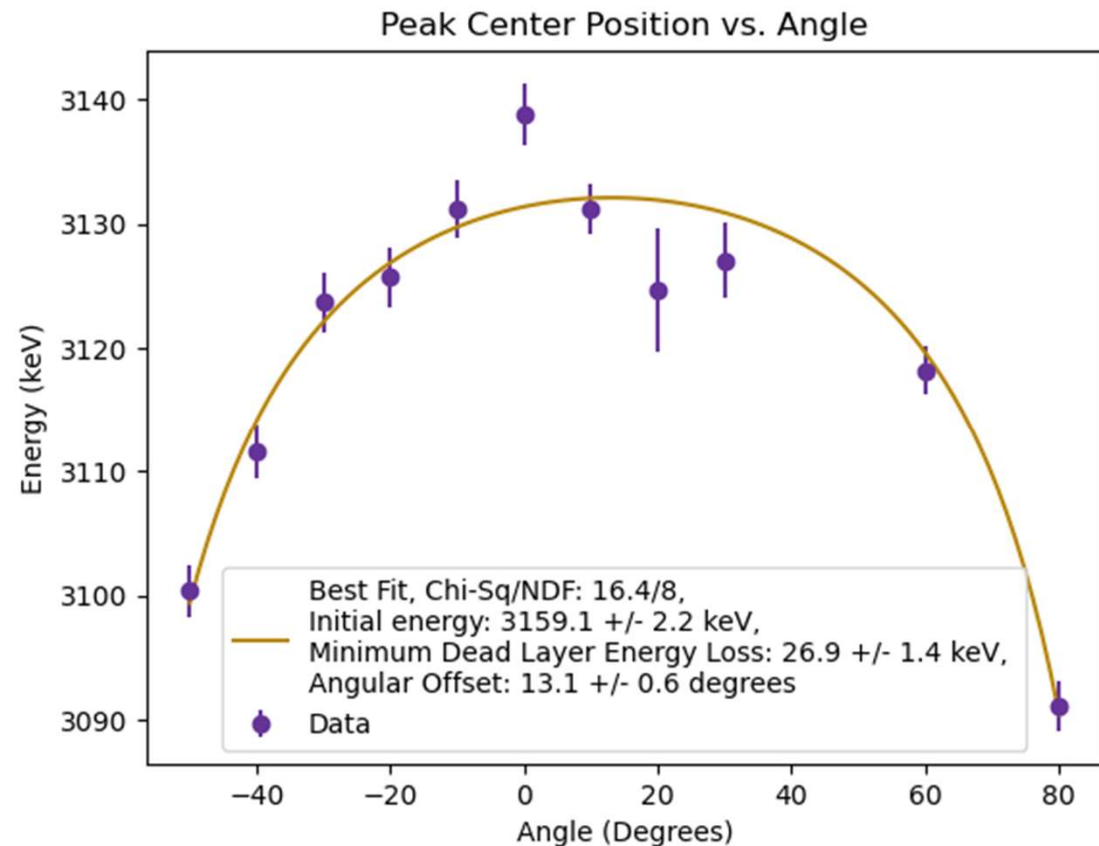

Twin Alpha Peaks

- Angular dependence
- Second smaller peak which behaves similarly

Results of Second Alpha Peak

- Fitted to $y = a - \frac{b}{\cos(x-c)}$
- Minimum Dead Layer Energy Loss: 26.9 ± 1.4 keV
- Energy loss coefficient for alpha particles in silicon: 170 ± 10 keV/micrometer
- Dead layer thickness: 158 ± 18 nm

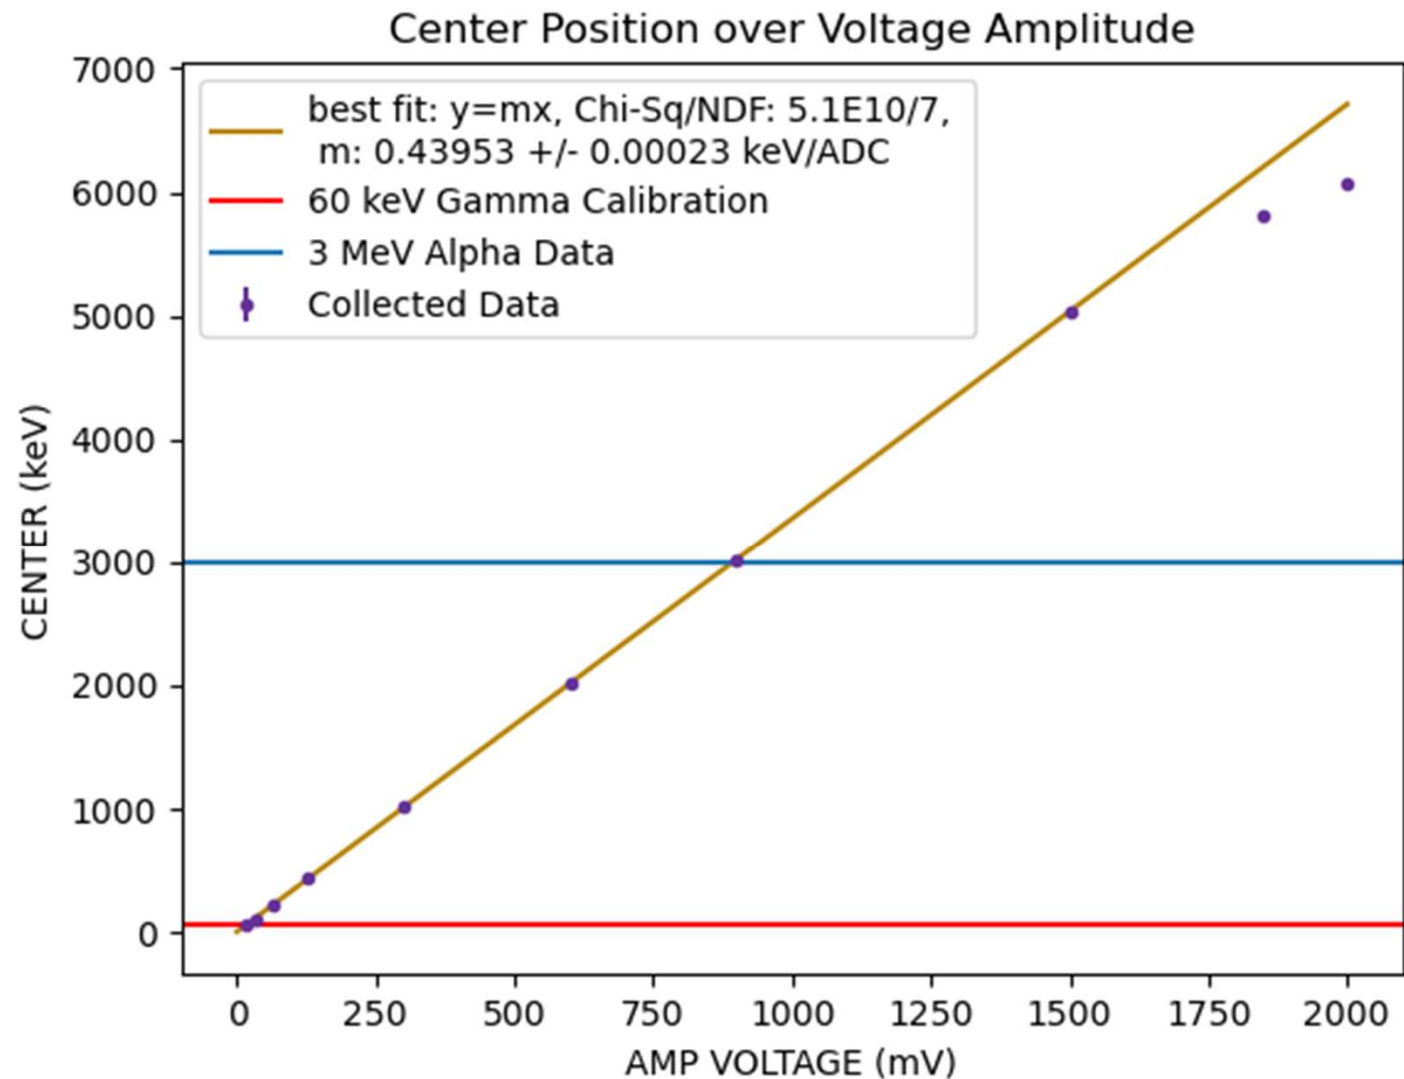

Systematics Investigation

UNIVERSITY *of* WASHINGTON

Linearity Scan

- Linearity of conversion factor holds for up to 5000 keV
- 0.05% error up to about 5000 keV

Potential Surface Irregularities

- Coating on source surface, with scratches
- Twin peaks with different initial energies
- Test by varying source “tilt” and path length through source coating

“Tilt” of the Source

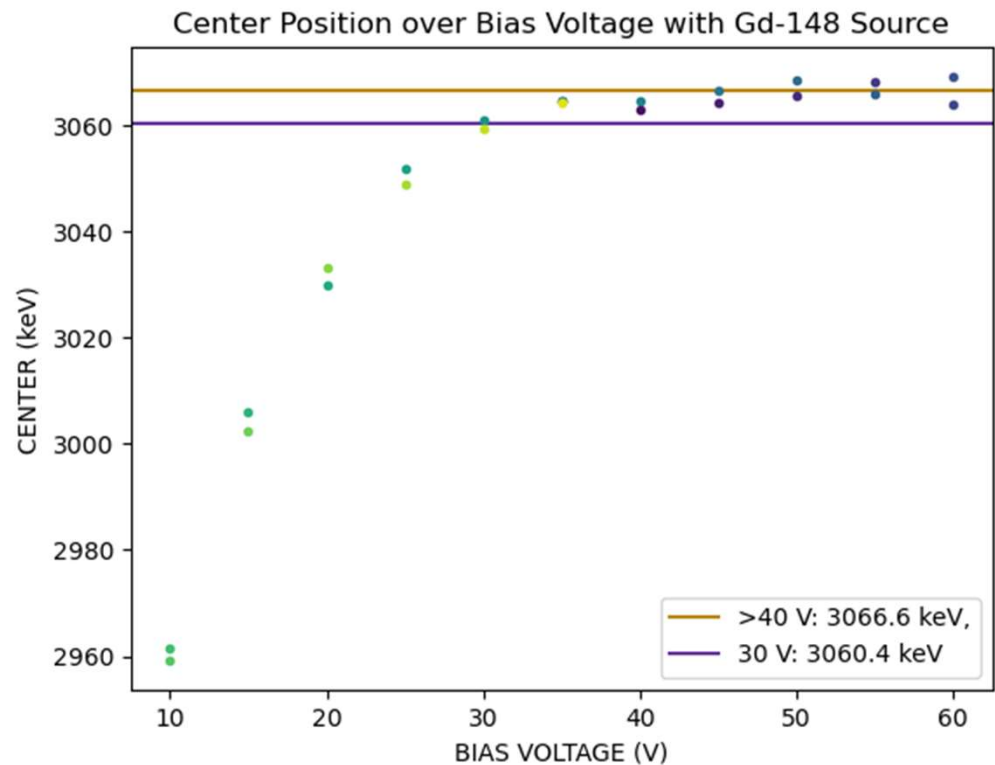

- Each run's energy scale independently calibrated with Americium-241 peak
- No change in peak position
- No coating on the source

UNIVERSITY of WASHINGTON

Bias Voltage Dependence

- 30 V bias used for angle scan
- 0.2% reduction in peak energy between 30 V and voltages above 30 V
- Additional 6.156 \pm 0.009 keV energy loss at 30 V
- 36.4 \pm 2.2 nm added to the dead layer

Monte Carlo Simulation in Python

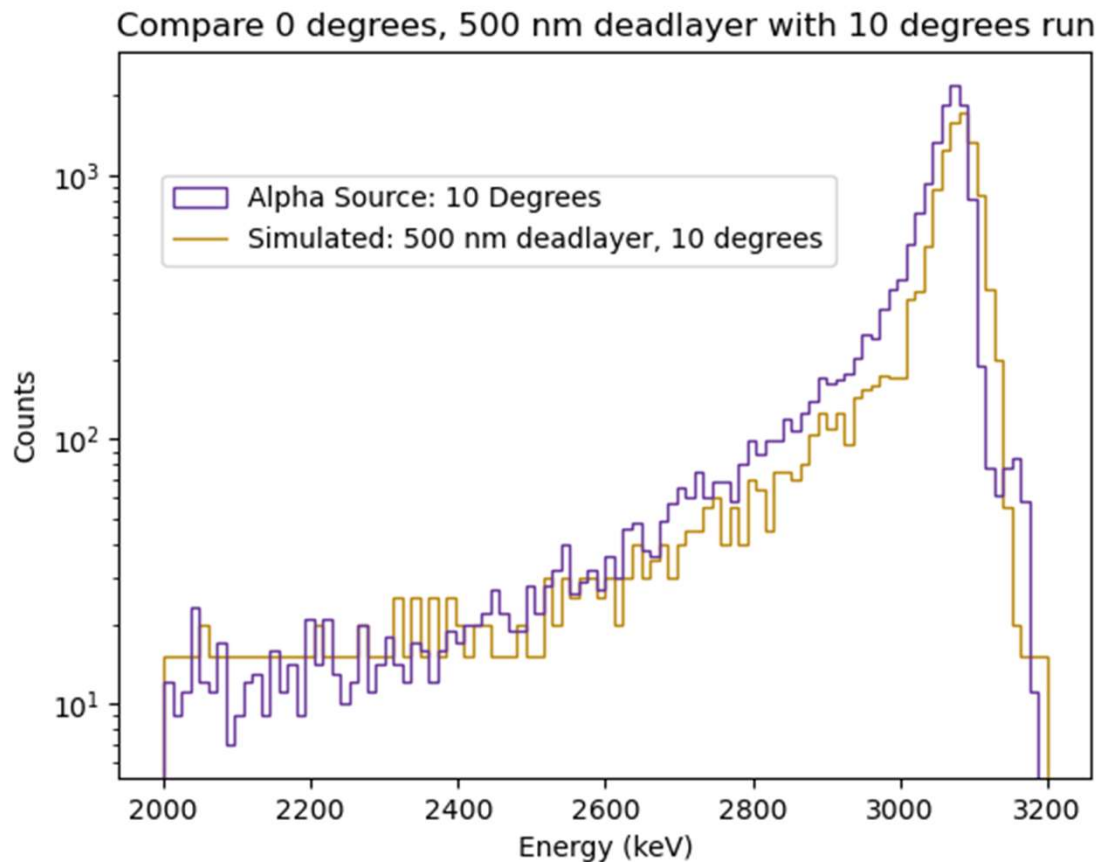

- Emission from a spherical source
- Selecting which particles impact a detector of surface area 70 mm^2
- Energy loss in the dead layer, impacted by the source angle, and the emission angle
- Two rounds of exponential energy loss
- Gaussian broadening

UNIVERSITY of WASHINGTON

Simulation Results

- Replicated spectrum shape
- Small effect of angular spread
- Can use simulated spectrum for future peak fitting

Conclusions and Future Steps

- > **Two dead layers:**
 - 302 +/- 5 nm
 - 122 +/- 8 nm
- > **Detector performance is comparable with the current detector, but further testing is needed**
 - Conduct future measurements with a bias voltage above 30 V
 - Further systematic error analysis
 - > Fit with non-Gaussian model

Institutional Acknowledgements

A big thank you to the following organizations for supporting me in this research experience:

Acknowledgments

- Thank you to the REU organizers!
- Thank you to my fellow REU interns for a great summer!
- Thank you to Sanshiro and Alexander for their support and guidance !
- Thank you to Matt for getting things to work!
- And thank you to the entire UW KATRIN group and CENPA!

What kinds of neutrinos are there?

Do you have a schematic for the pre-amplifier?

HINGTON

What are the ADC specifications

- ADC output range: 0 to 16,000
- 150 megasamples per second
- Caen Model 725

What are the usual standard model particles?

Why is KATRIN getting replaced by Project-8?

- KATRIN's resolution limit is determined by the size of the main spectrometer
- KATRIN's size limit is determined by the size of the main street in Karlsruhe
- It has hit that size limit

~10% Energy Resolution Drop in Response to Temperature Increase

- Allowed liquid Nitrogen to boil off over 48 hours
- Not indicative of leakage current as a prominent noise source

Fourier Frequency Analysis: Linear

Fourier Frequency Analysis: Logarithmic

Simulation Geometry

- Spherical emission from source
- X-position of hits varies with angle theta
- Y-position is randomly scattered about zero
- Pivot length
