000 Neutron Star Crust

How is a Neutron Star crust formed?

- **Neutron Star accretes** material from a companion star.
- <span id="page-2-0"></span>• Accreted material undergoes nuclear reactions.

Figure: NASA concept of Cygnus X3.

 $\mathbf{E} = \mathbf{A} \oplus \mathbf{A} + \mathbf{A$ 

[Introduction](#page-2-0) [Multicomponent System](#page-4-0) [Simpler Systems](#page-7-0) [Phase Diagrams](#page-12-0) [Conclusions](#page-20-0)  $000$ Neutron Star Crust

What is the composition of the crust?

- Rapid proton capture  $(rp\text{-process}) \Rightarrow \text{medium mass}$ nuclei are synthesized.
- Ash of rp-process is buried by further accretion and density increases.
- Electron capture occurs  $\Rightarrow$ nuclei become neutron rich.
- Further accretion pushes mixture deeper into the star and density increases further.
- At  $\sim 10^{10}$  g/cm $^3$  freezing and chemical separation occurs.

Figure: Schematic diagram of an accreting neutron star.

Molecular Dynamics of a 17 component plasma (Horowitz et al. 2007).

Start system with composition expected near the ocean-crust interface of accreting neutron stars (Gupta et al. 2007).

- Evolve the system keeping it half solid half liquid;
- Obtain phase transition temperature;
- <span id="page-4-0"></span>• Observe phase separation.

Figure: Number abundance  $y_Z$  vs atomic number Z.

### Multicomponent System

<span id="page-6-0"></span>Figure: Composition profile in the convection zone of a  $T = 3 \times 10^8$ K ocean composed of  $56Fe^{-79}$ Se (solid line) and  $16O^{-79}$ Se (dashed line). Model by Medin and Cumming 2010.

Simulation with 55296 ions.

- Set Carbon to Oxygen ratio.
- Make a half-solid half-liquid system.
- Evolve system adjusting the temperature to keep solid to liquid ratio approximately constant.
- Look at properties of the system in both phases.
- Equilibrate the system for a long time:

$$
t\simeq 2\times 10^6/\bar{\omega}_{\textit{p}}
$$

where

$$
\bar{\omega}_{\bm\rho}=\left[\frac{4\pi e^2\langle Z\rangle^2n}{\langle M\rangle}\right]^{1/2}
$$

<span id="page-9-0"></span>Figure: Close-up on final  $50\frac{12}{c}$ C and  $50\frac{16}{c}$ O configuration. Colors indicate different phases. Silver, Red, Green: <sup>12</sup>C in solid, interface and Iiquid. Blue, Black, Grey: <sup>16</sup>O in solid, interface [an](#page-8-0)[d l](#page-10-0)[iq](#page-6-0)[u](#page-7-0)[i](#page-9-0)[d.](#page-10-0)

Define a local orientation order parameter for each ion i

$$
\bar{q}_{lm}(i) \equiv \frac{\sum_{j=1}^{N_i} Y_{lm}(\hat{\mathbf{r}}_{ij}) \alpha(r_{ij})}{\sum_{j=1}^{N_i} \alpha(r_{ij})}.
$$

•  $\alpha(r_{ii})$  is a weight function;

•  $N_i$  are ions within a (chosen) distance  $r_{cut}$  of ion i. The  $\bar{q}_{lm}(i)$  are complex components of a vector in  $(2l + 1)$ dimensions. Define a dot-product (rotational invariant)

$$
\mathbf{q}_i(i)\cdot \mathbf{q}_i(j)=\sum_m \tilde{q}_{lm}(i)\tilde{q}_{lm}^*(j).
$$

**KORK ERKER ADE YOUR** 

<span id="page-10-0"></span>The  $\tilde{\bm{q}}_{lm}(i)$  are the normalized  $\bar{\bm{q}}_{lm}(i)$ , such that  $\bm{q}_{l}(i) \cdot \bm{q}_{l}(i) = 1$ .

The  $l = 6$  order parameter is the most sensitive to our crystalline structure.

- If  $\mathbf{q}_i(i) \cdot \mathbf{q}_i(j) \geq 0.5$  particles are connected.
- If  $\mathbf{q}_l(i) \cdot \mathbf{q}_l(j) < 0.5$  particles are not connected.

If a particle  $i$  is connected to

- more than 80% of its neighbors it is labeled solid;
- $\bullet$  less than 20% of its neighbors it is labeled liquid;
- more than 20% and less than 80% it is labeled interface.

- Knowing the phase diagram allows for better determination of stellar age, composition, ...
- Neon <sup>22</sup>Ne sedimentation may be an important source of energy during the cooling of a White Dwarf Star.
- <span id="page-13-0"></span>• Knowing how the Neon phase separates as the star freezes could also be important for Type Ia Supernovae.

<span id="page-14-0"></span>Figure: Phase Diagram for Carbon Oxygen Neon mixtures. Blue dots are the initial composition. Conclusions and Future Work

Though computationally expensive MD can

- be used to study phase diagram and dynamical properties of dense plasmas (WD interiors and NS crust);
- **•** give us insights and data which can be used to build analytical models.

**KORK ERKER ADE YOUR** 

<span id="page-20-0"></span>Future: Use MD to study more complex phase diagrams. Suggestions?
