

KLOE small angle tagger

Dario Moriccianni
INFN Roma Tor Vergata

On behalf KLOE-2 Collaboration

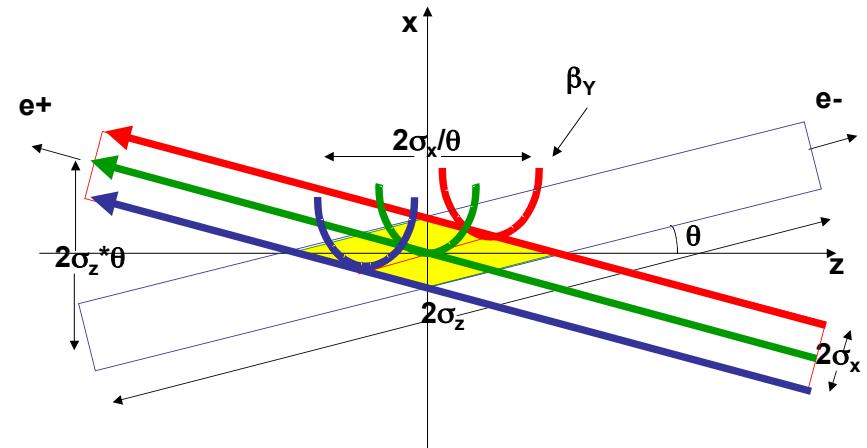

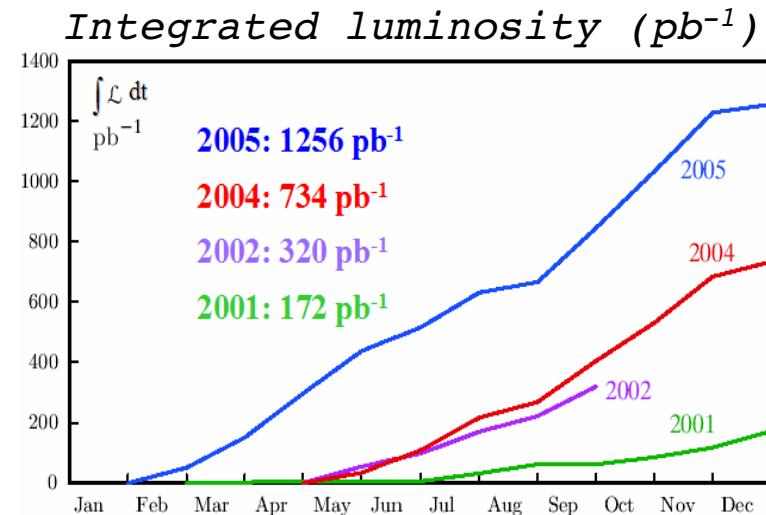

“INT Workshop on Hadronic Light-by-Light Contribution to the Muon Anomaly”
February 28-March 4, 2011

History of KLOE@DAΦNE

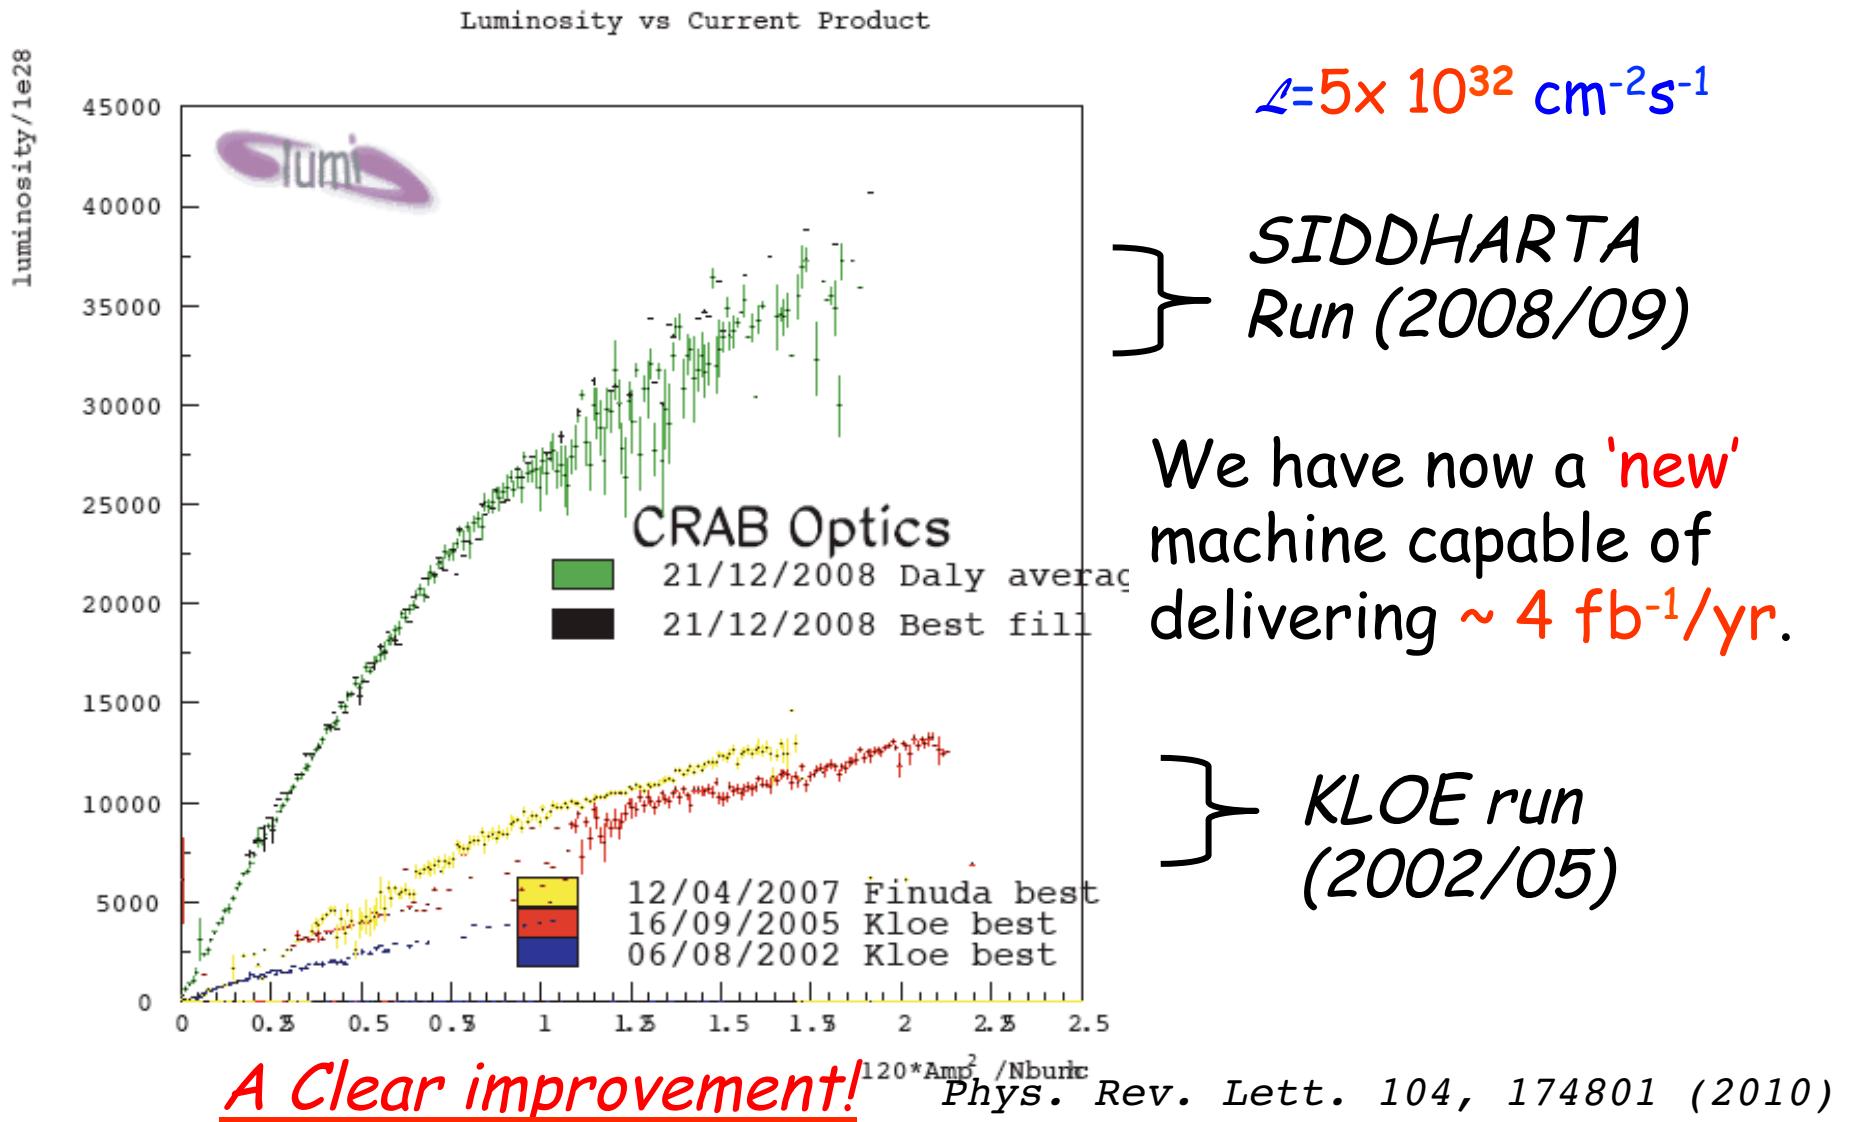

- Frascati ϕ -factory :
 e^+e^- collider @ $\sqrt{s} \approx 1020$ MeV $\approx M_\phi$;
- Best performances in 2005:
 - $L_{\text{peak}} = 1.4 \times 10^{32} \text{ cm}^{-2}\text{s}^{-1}$
 - $\int L dt = 8.5 \text{ pb}^{-1}/\text{day}$
- KLOE: 2.5 fb^{-1} @ $\sqrt{s}=M_\phi$ and
 $+ 250 \text{ pb}^{-1}$ off-peak @ $\sqrt{s}=1 \text{ GeV}$
- New interaction scheme implemented : large beam crossing angle + crabbed waist sextupoles

Luminosity increase factor ~ 3

$$\int L dt \approx 1 \text{ pb}^{-1}/\text{hour}$$

DAΦNE luminosity: new vs old

KLOE-2 Physics Program

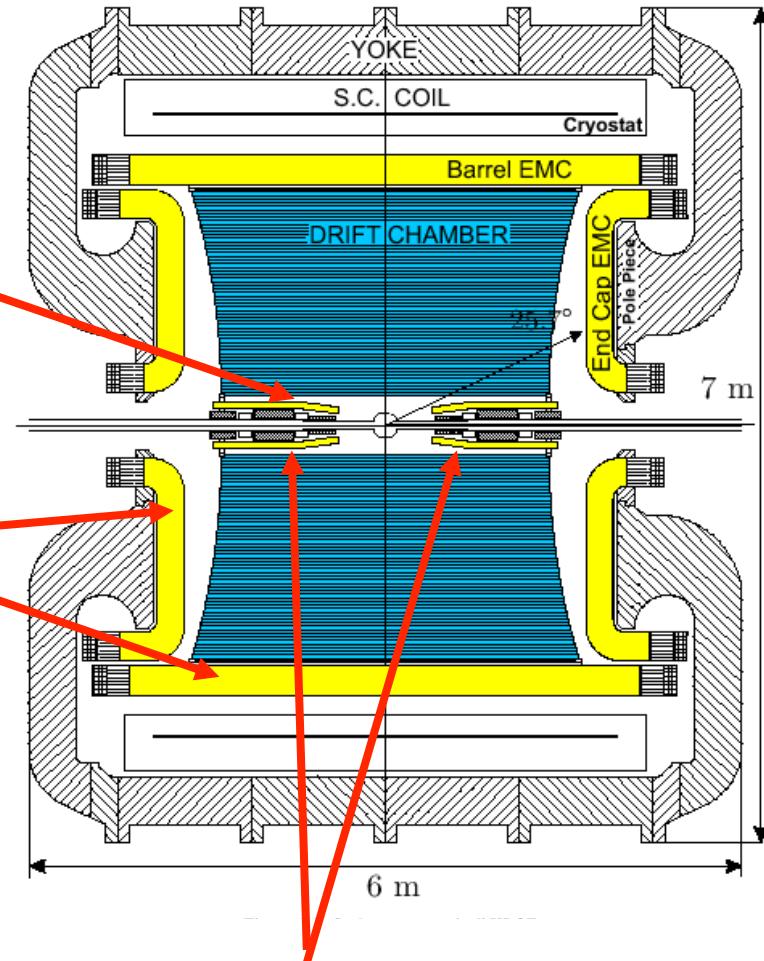

- $\gamma\gamma$ physics
 - Study of $\Gamma(S/PS \rightarrow \gamma\gamma)$, test of χ PT, existence and properties of $\sigma(600)$ meson, PS Transition Form Factor
- Kaon Physics
 - Test of CPT (and QM) in correlated kaon decays
 - Test of CPT in K_S semileptonic decays
 - Test of SM (CKM unitarity, lepton universality)
 - Test of χ PT (K_S decays)
- Spectroscopy of light mesons
 - $\eta, \eta', f_0, a_0, \sigma$ in ϕ radiative decays
- Dark Matter searches (light bosons at $O(1 \text{ GeV})$)

References : KLOE-2 Collaboration EPJC68,(2010),619

KLOE Detector

Drift chamber:

- gas: 90% He-10% C_4H_{10}
- $\delta p_T/p_T = 0.4\%$
- $\sigma_{xy} \approx 150 \mu m$; $\sigma_z \approx 2 mm$
- $\sigma_{vertex} \approx 1 mm$

Calorimeter (Pb-Sci.Fi.):

- $\sigma_E/E = 5.7\% / \sqrt{E(GeV)}$
- $\sigma_t = 55 ps/\sqrt{E(GeV)} \oplus 100 ps$
- 98% of 4π

Magnetic field: 0.52 T

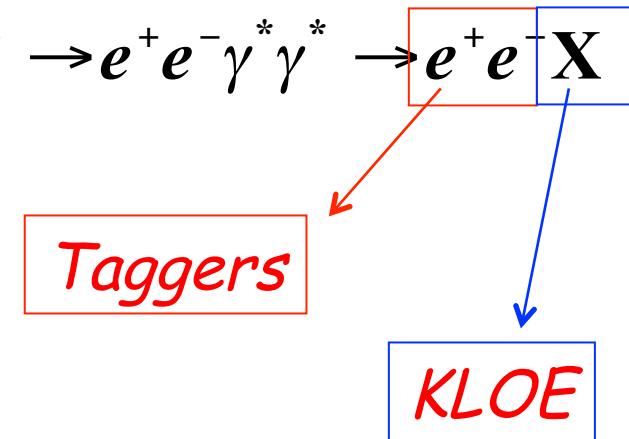

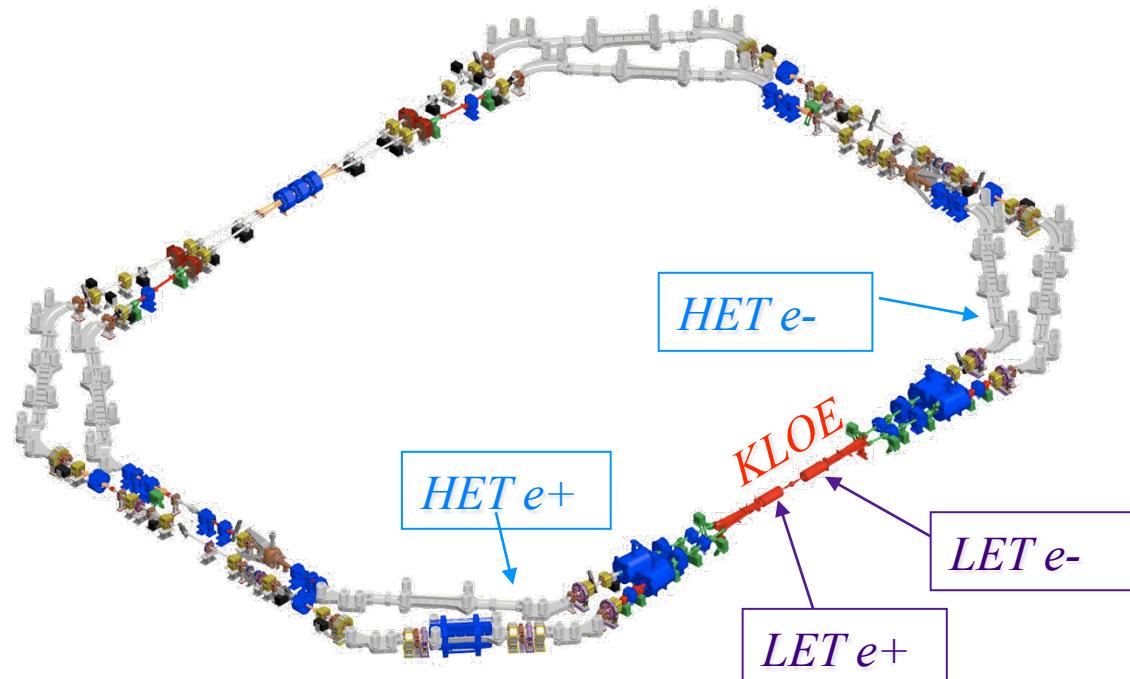

QCAL vetos: (Pb-scintillator)

...to KLOE-2...(Step0)

Minimal detector upgrades:

Tagger for $\gamma\gamma$ physics: detection off-momentum leptons

in order to study $e^+e^- \rightarrow e^+e^-\gamma^*\gamma^* \rightarrow e^+e^-X$

Data
taking start
next months

Why we need taggers ?

$\gamma\gamma$ physics can be done at a ϕ -factory, on the ϕ peak:

- gives access to many interesting final states through photon emission from both colliding electron and positron

TRUE, BUT...

$\gamma\gamma$ events acquired at the ϕ peak would suffer from ϕ decays as background

$\gamma\gamma$ channel	($L = 10 \text{ fb}^{-1}$)
$e^+ e^- \rightarrow e^+ e^- \pi^0$	4×10^6
$e^+ e^- \rightarrow e^+ e^- \eta$	1×10^6
$e^+ e^- \rightarrow e^+ e^- \pi^+ \pi^-$	2×10^6
$e^+ e^- \rightarrow e^+ e^- \pi^0 \pi^0$	2×10^4

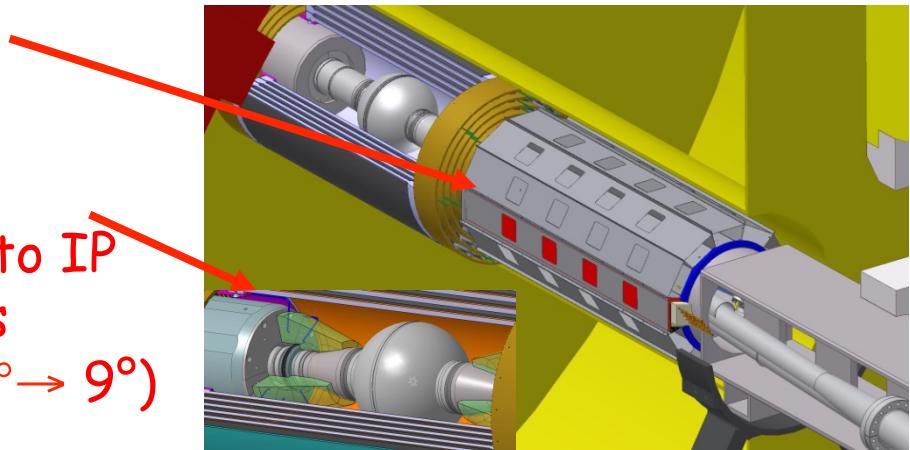

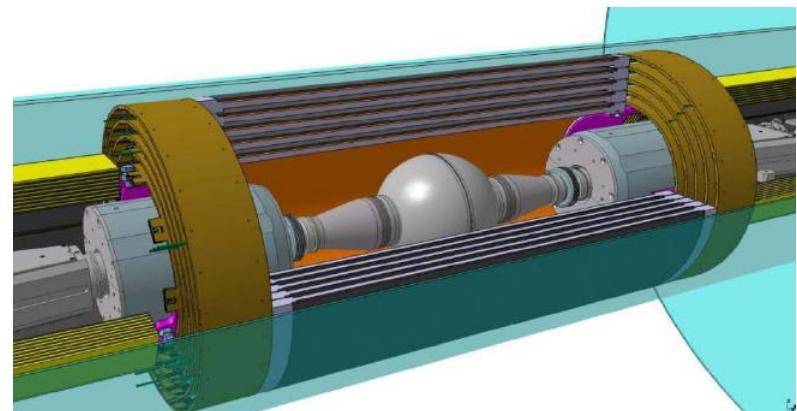

ϕ decays	Missing particle	Events ($L = 10 \text{ fb}^{-1}$)	Background for :
$K_S(\pi^0 \pi^0) K_L$	K_L	$\sim 10^9$	$\pi^0 \pi^0$
$K_S(\pi^+ \pi^-) K_L$	K_L	$\sim 2 \times 10^9$	
$\pi^+ \pi^- \pi^0$	π^0	$\sim 10^9$	
$\eta(\gamma\gamma) \gamma$	γ	$\sim 10^8$	η
$\pi^0(\gamma\gamma) \gamma$	γ	$\sim 5 \times 10^8$	π^0

tagging $\gamma\gamma$ events by detecting $e^+ e^-$ is mandatory to reduce backgrounds, together with P_T kinematical selection on the tagged events.

...to KLOE-2...(Step1)

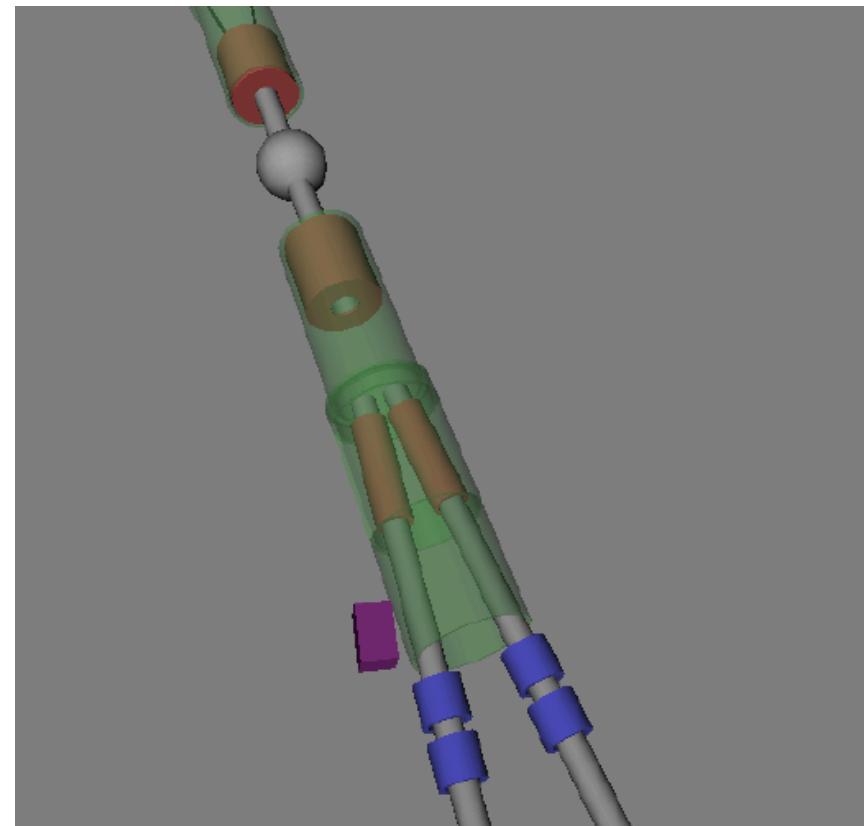

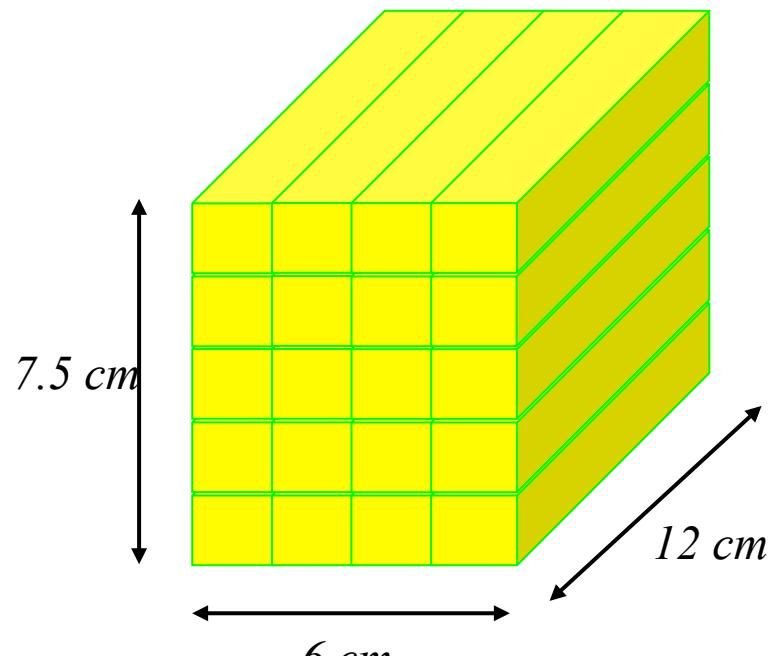

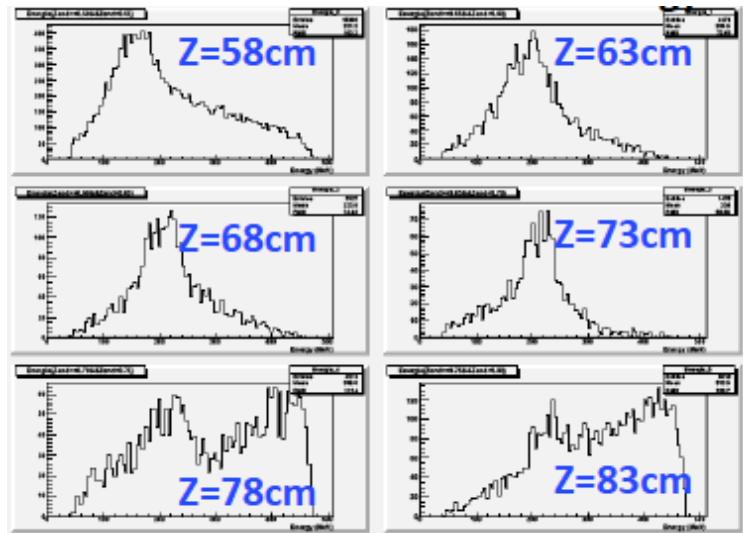

Major detector upgrade

- Inner tracker (between the beam pipe and the DC): 4 layers of cylindrical triple GEM:
 - improve vertex reconstruction near the IP
- QCALT: W + scint. tiles readout by SiPM via WLS fibers
- CCAL: LYSO crystals + APD; close to IP to increase acceptance for photons coming from the IP (min. angle: $21^\circ \rightarrow 9^\circ$)

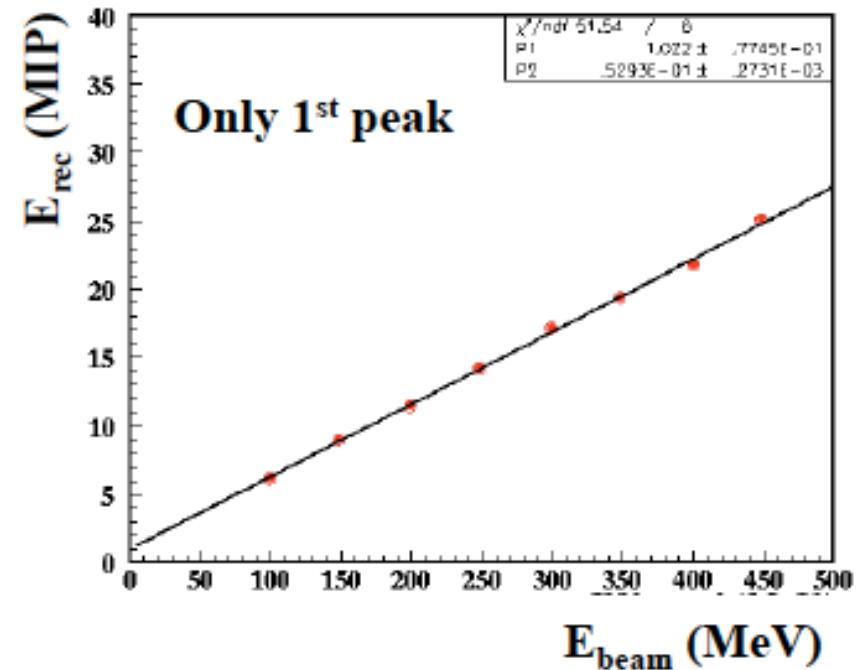

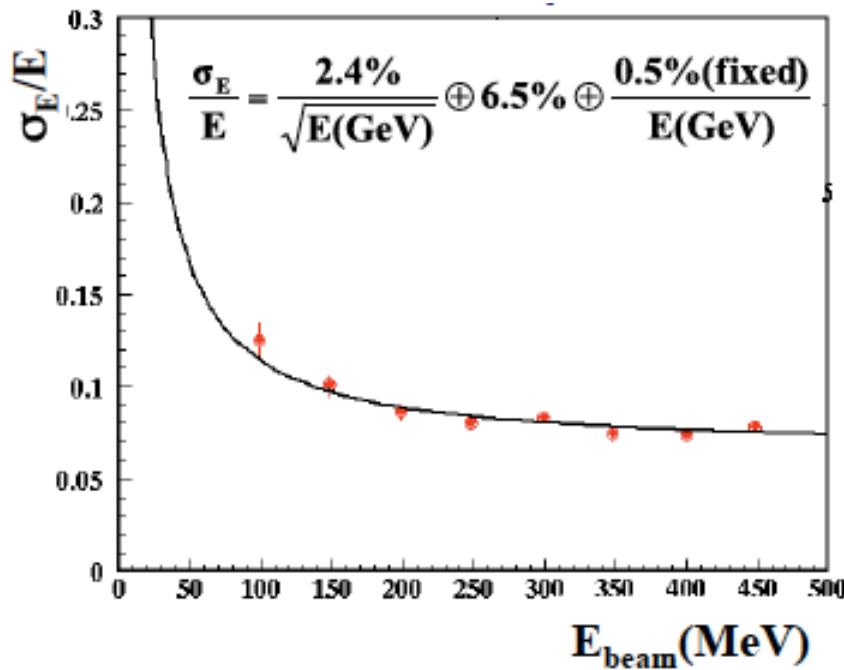

Time scale: installation in late 2011

LET Characteristics

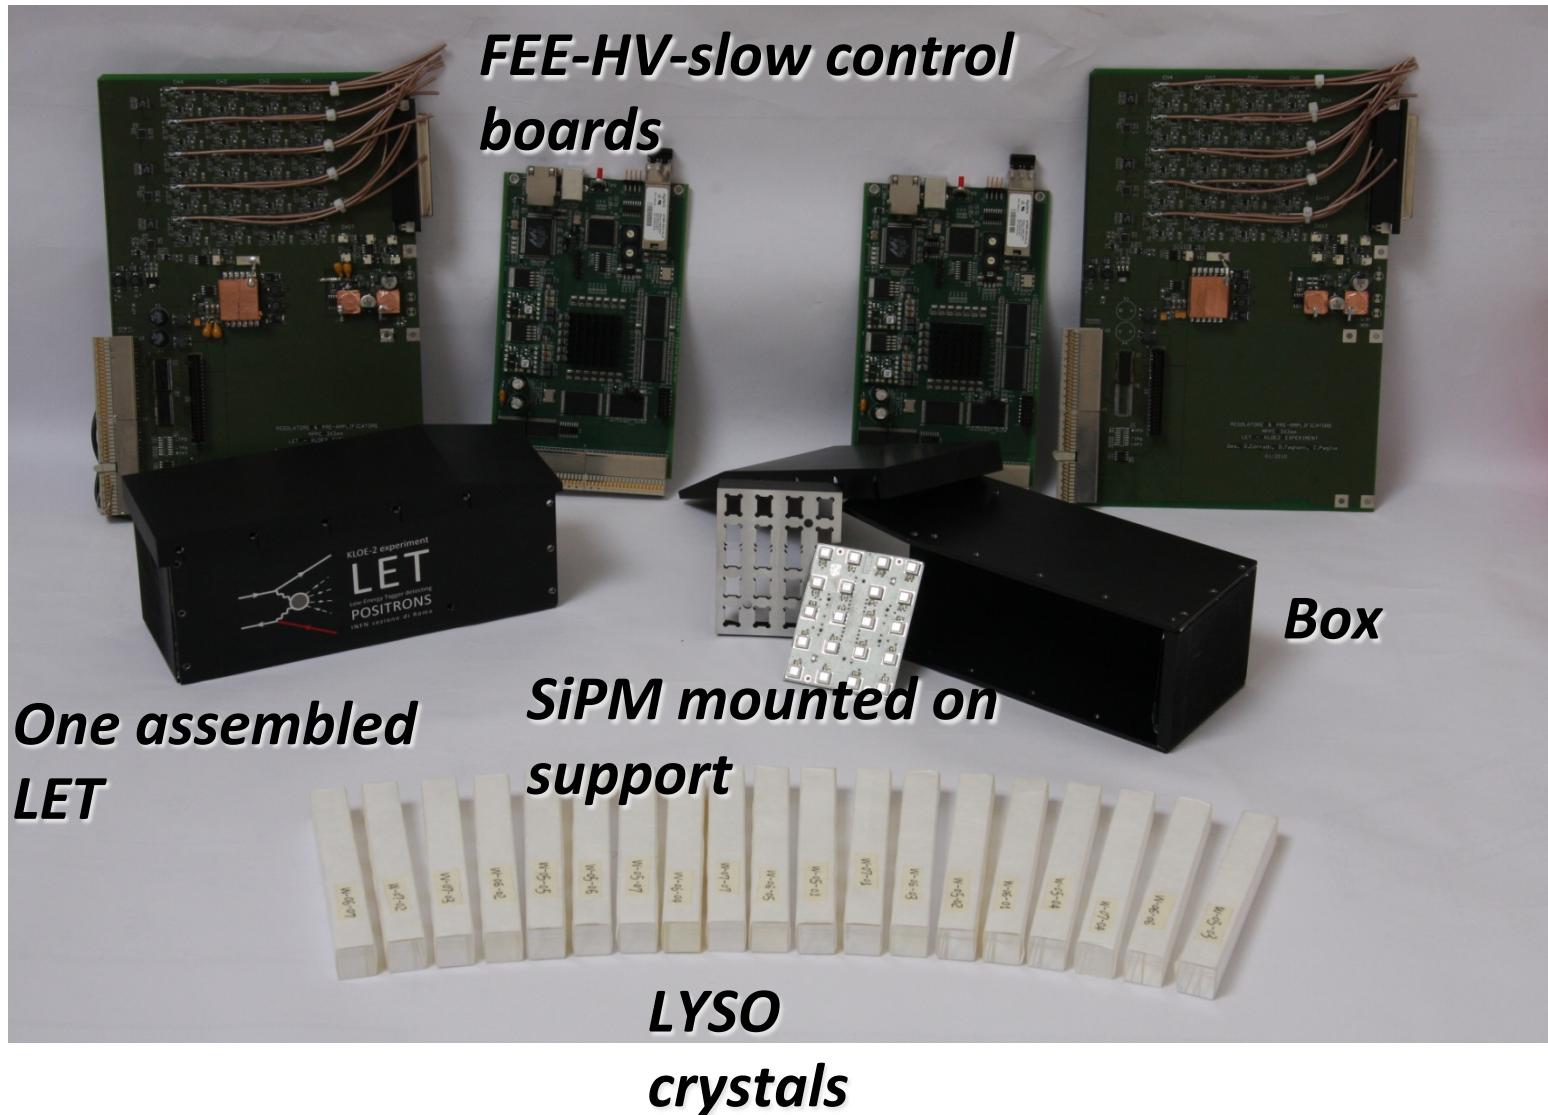

LET: Low Energy Tagger
(160-230 MeV) lepton
energy
Calorimeters, LYSO + SiPM

LET system and performance

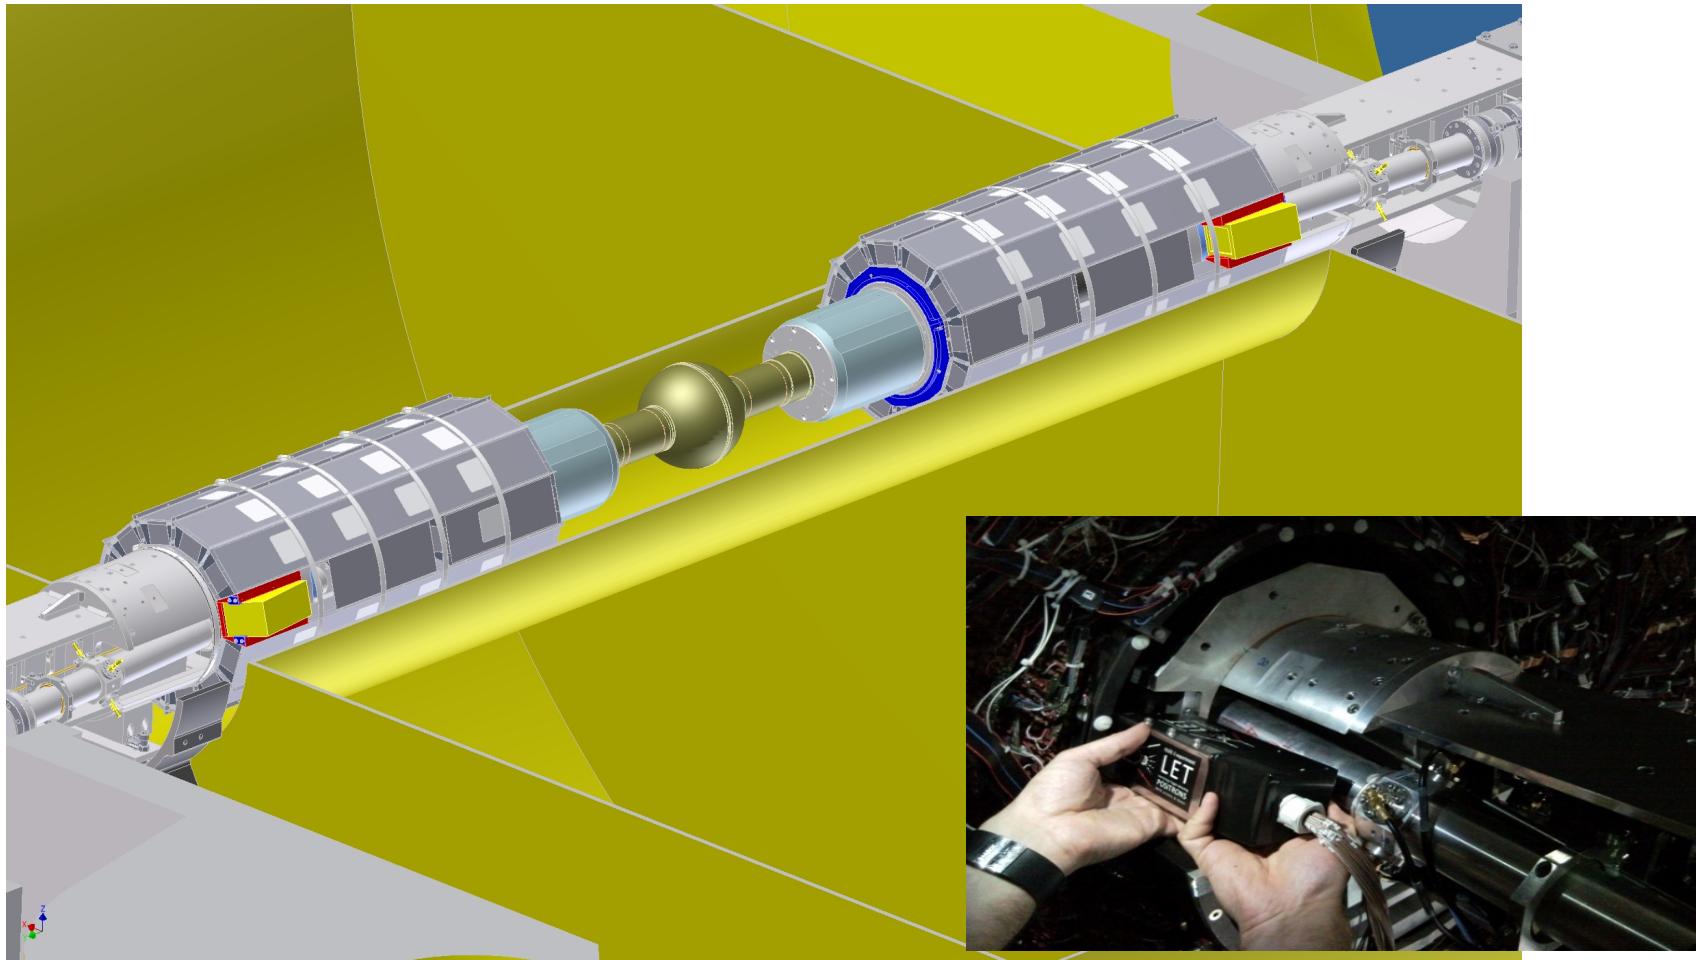

- 3rd term is fixed, since we have about 5 MeV noise
- Statistical term higher than expected ($20 \text{ p.e./MeV} \rightarrow \text{less than } 1\%/\text{E}^{1/2}(\text{GeV})$)
- Contribution to constant term due to lateral leakage (matrix not fully readout)
- There is an unknown contribution from the beam
- Resolution is better than 10% for $E > 150 \text{ MeV}$

LET detectors component

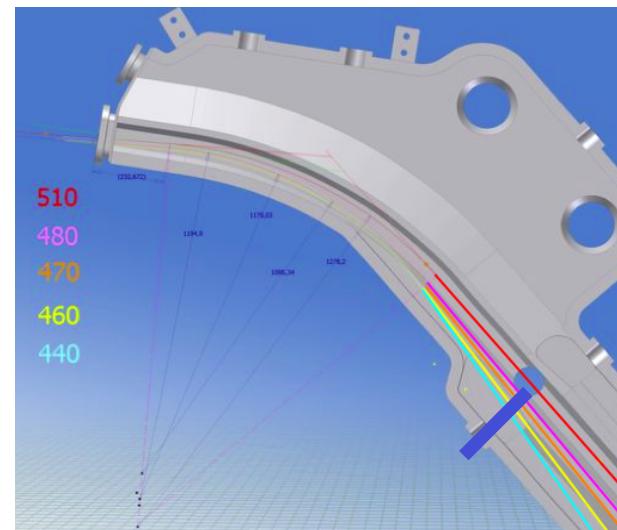

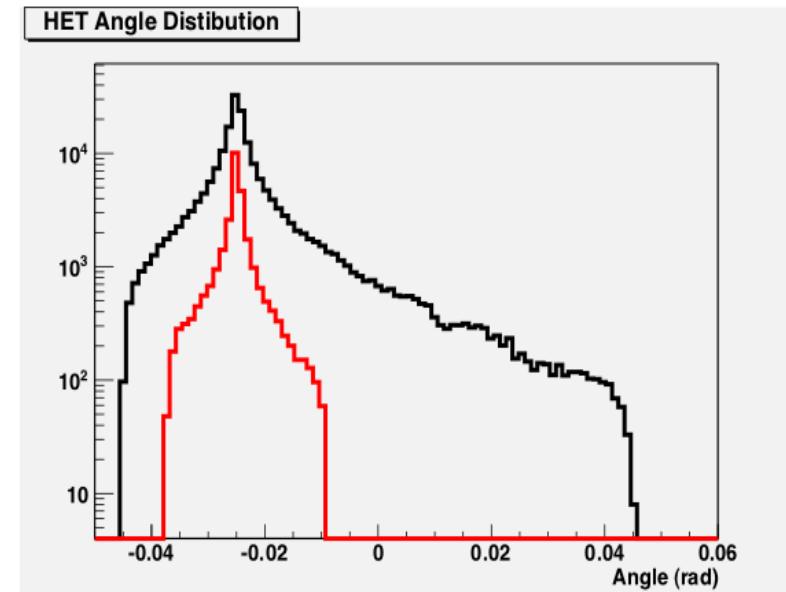

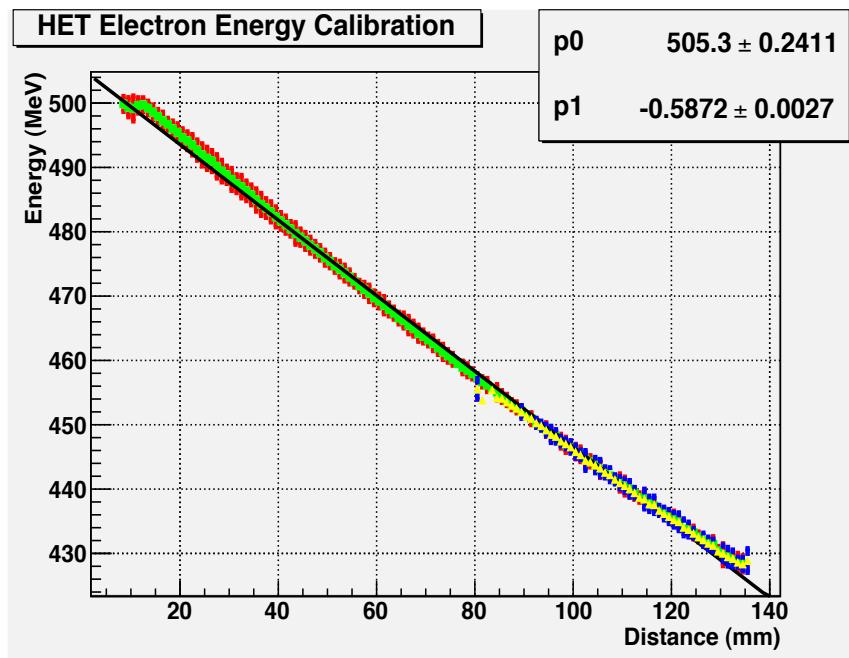

LET Installation

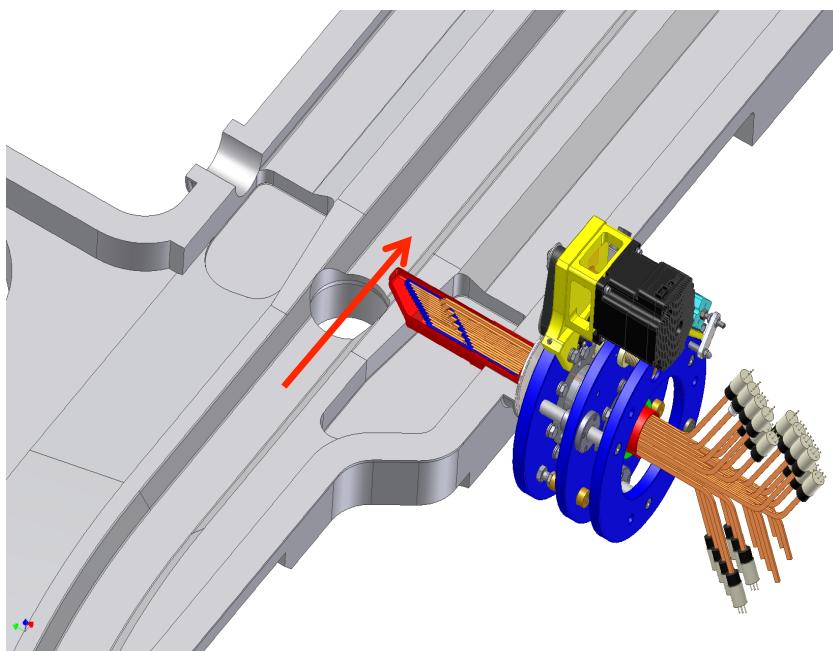

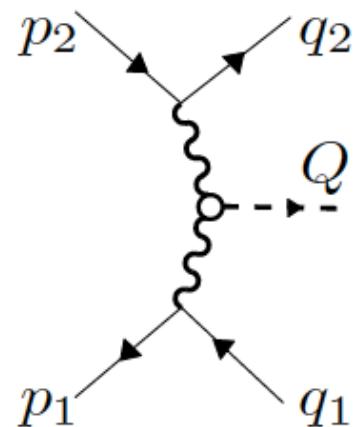

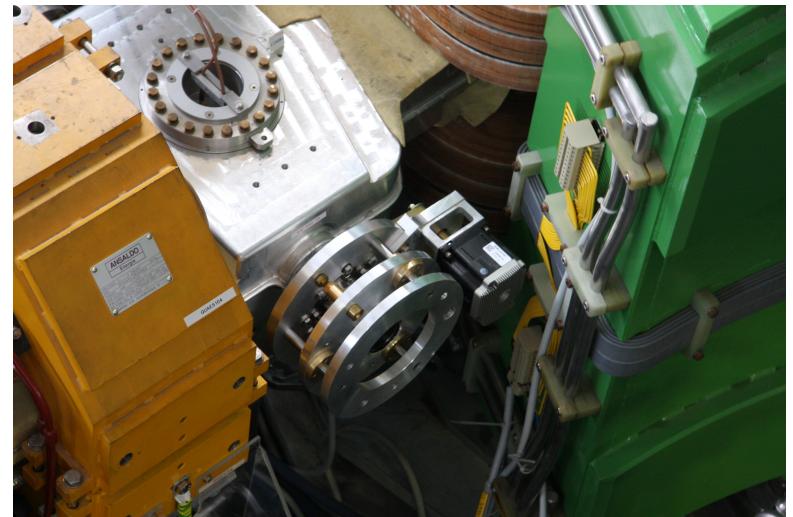

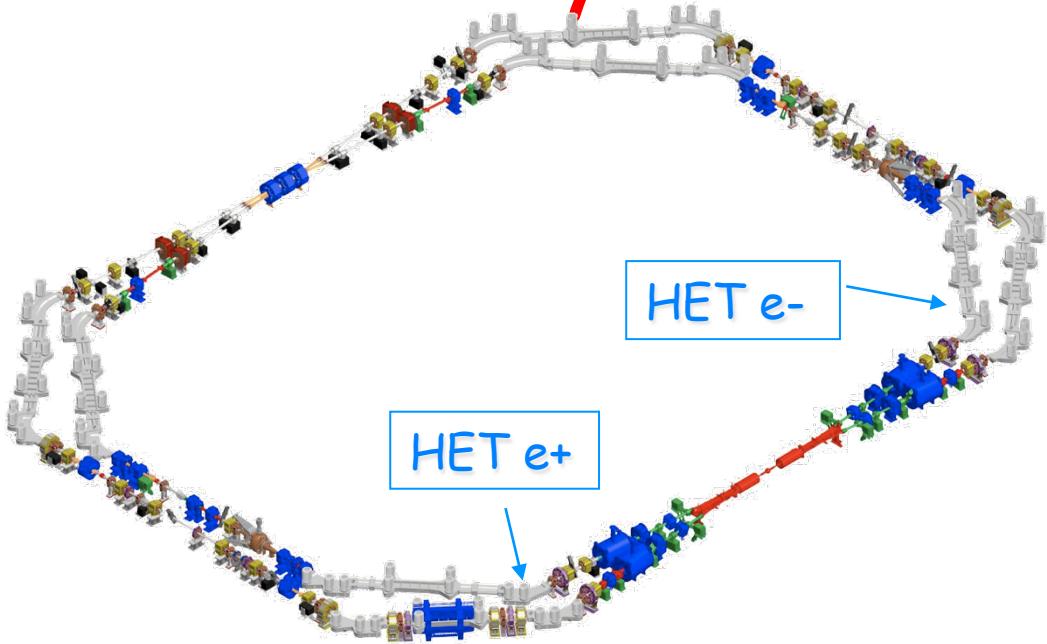

LET in place

HET characteristics

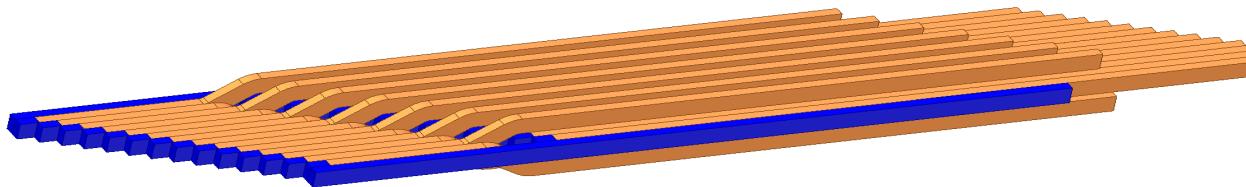

The detector will be located at 11 m from the IP behind a bending magnet. Plastics + PMTs

HET systems

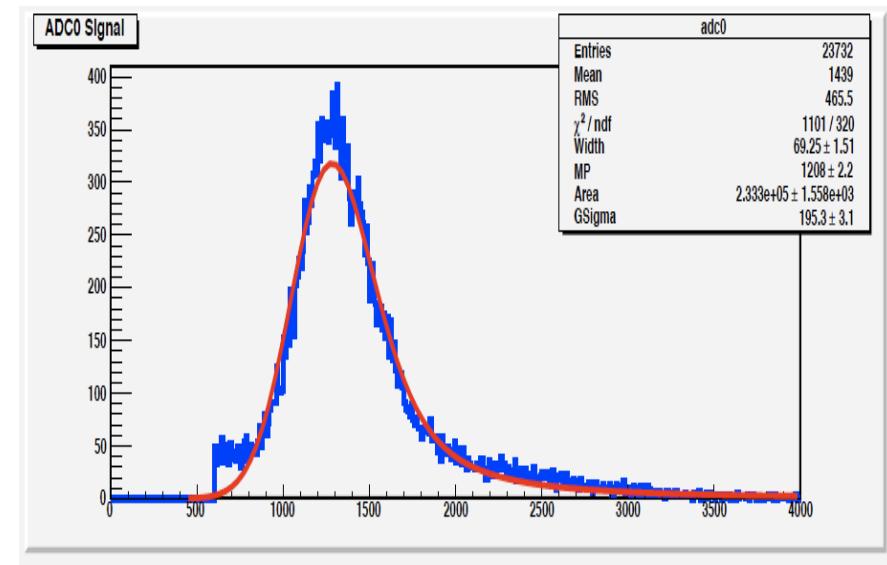

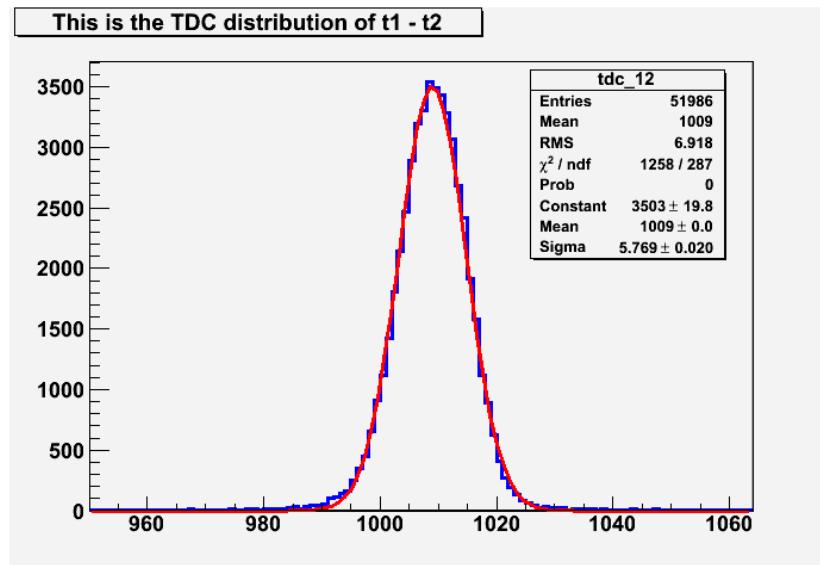

HET detector

- Minimum safe distance from beam line is of 3-5 cm.
- Hodoscope made by two rows of 15 scintillators of $3 \times 5 \times 6 \text{ mm}^3$
→ pitch resolution $\sim 5 \text{ mm}$, i.e. 2.5 MeV momentum resolution.
- Fast EJ228 (ELJEN) scintillator used. Light transported to photosensor with light guides. PMT Hamamatsu R9880-U110 readout (QE $\approx 35\%$).

HET performance

HET prototype successfully tested at LNF-BTF

L.Y. in excess of 40 pe/MIP \rightarrow 200 ps resolution which should allow clear separation between consecutive bunches.

Bunch structure on DaΦne

You have to take picture of HETs
for any bunches:

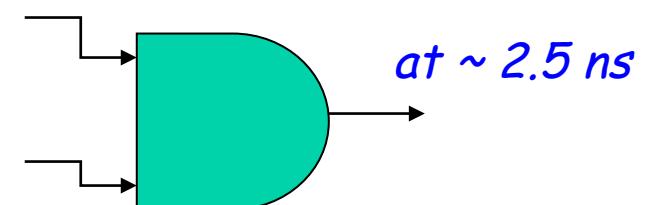

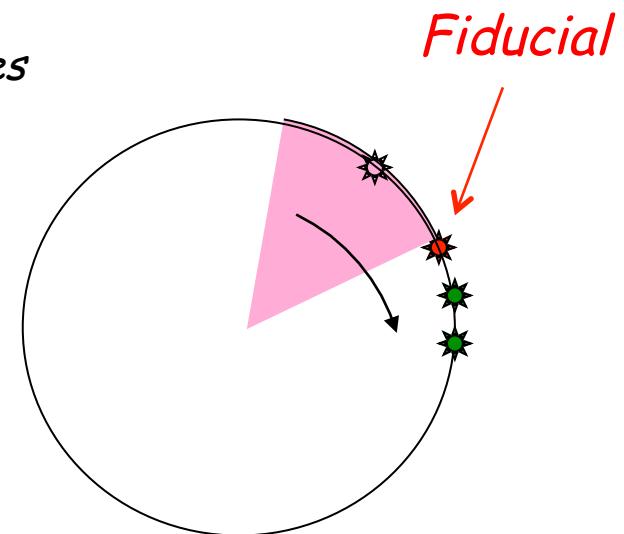

B_0 HETe⁻, B_0 HETe⁺

B_i HETe⁻, B_i HETe⁺

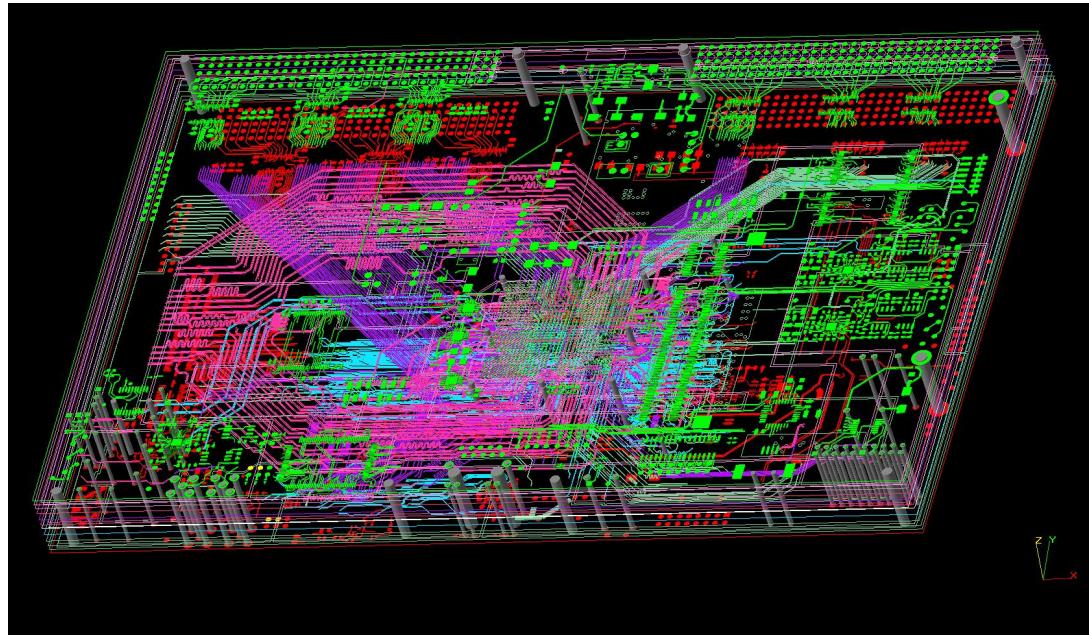

B_n HETe⁻, B_n HETe⁺

} And store it
for 2 revolution

Where same B_i means software :

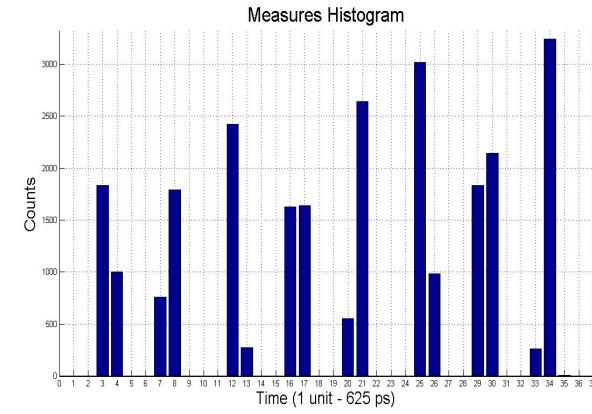

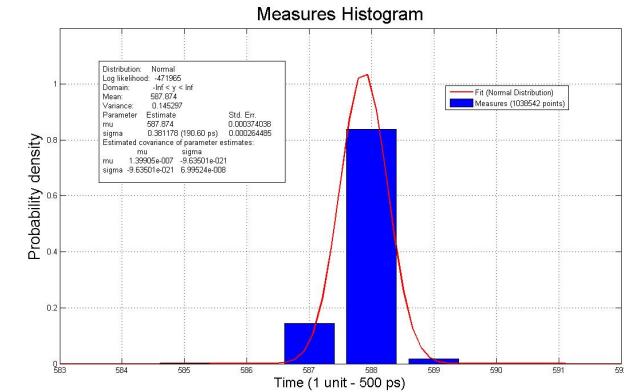

We need special Electronic in order to acquire data

- Front End
- Discriminator
- TDC con DAQ a 368 MHz with ~ 250 ps resolution

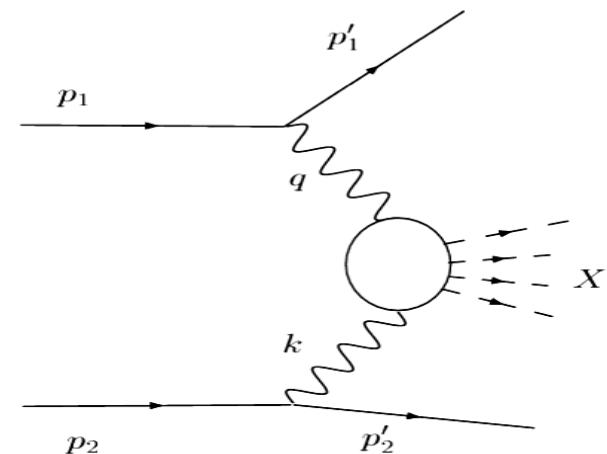

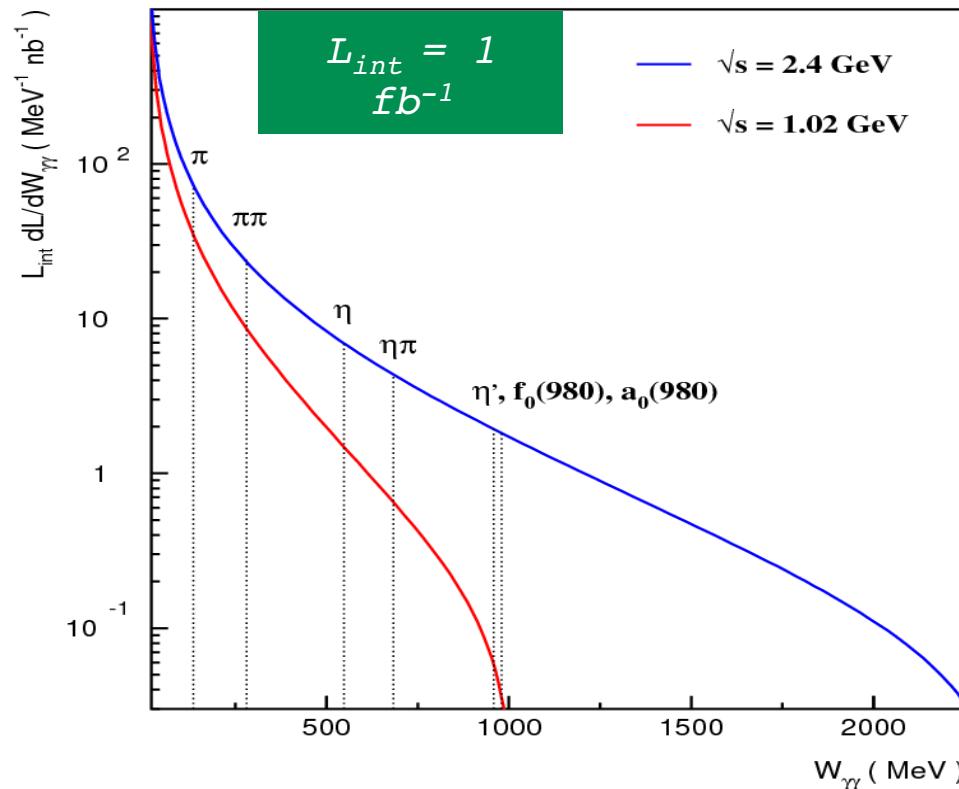

**VIRTEX 5
FPGA**

$\gamma\gamma$ - physics

$$e^+ e^- \rightarrow e^+ e^- \gamma^* \gamma^* \rightarrow e^+ e^- X$$

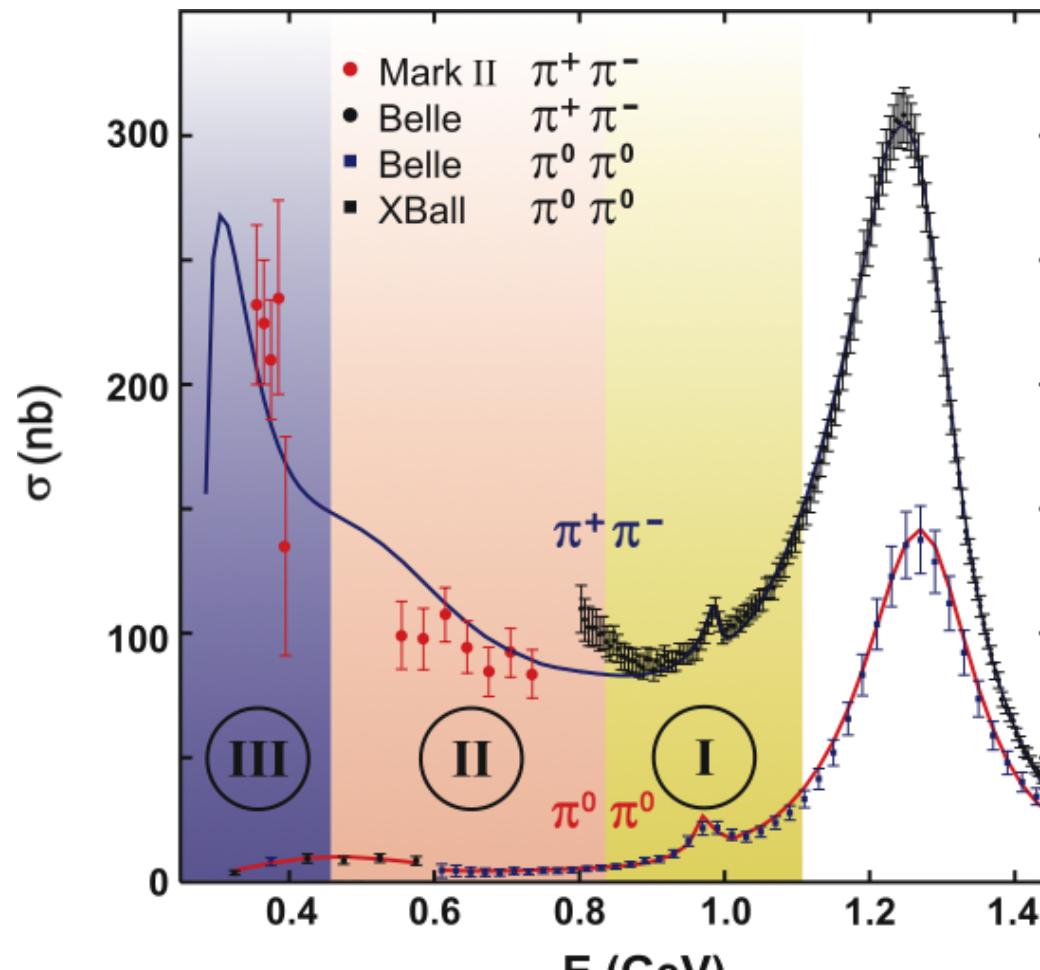

$$\frac{dN_X}{dW_{\gamma\gamma}} = L_{int} \frac{dL}{dW_{\gamma\gamma}} \sigma (\gamma\gamma \rightarrow X)$$

$X \equiv \pi\pi \rightarrow \sigma$ meson
ChPT tests

$X \equiv \pi^0, \eta \rightarrow$ 2-photon widths
transition
FFs @ low q^2

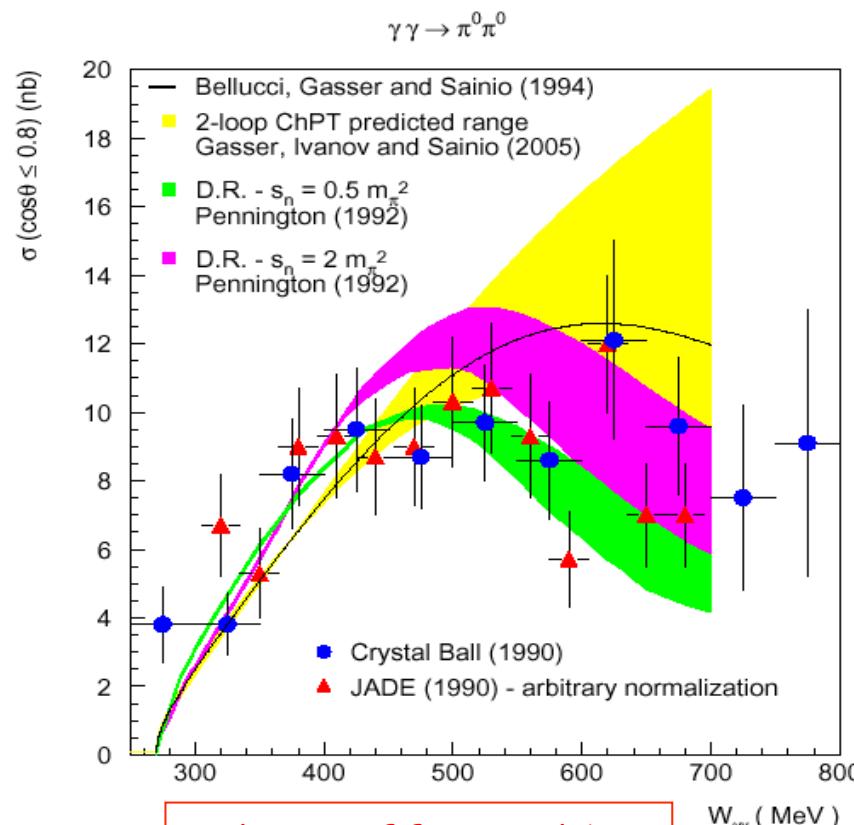

$(W_{\gamma\gamma} = M_X)$

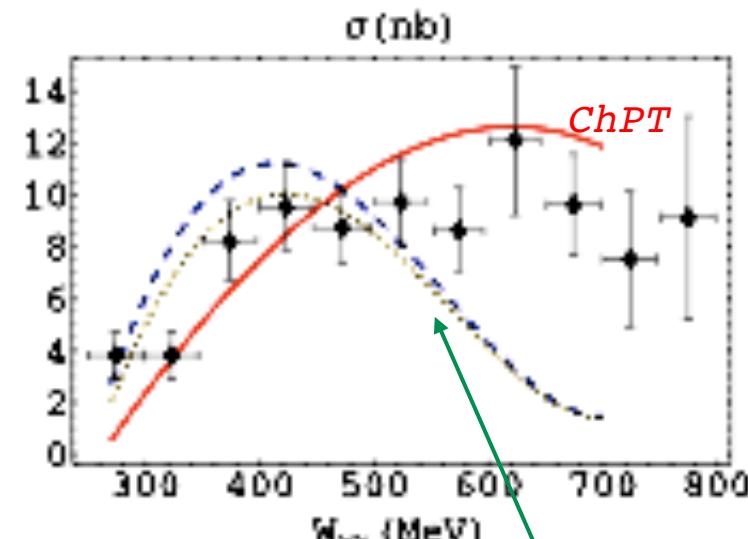

M. R. Pennington (arXiv:0906.1072)

σ meson case

Cleanest channel to assess existence & nature (2q vs 4q)
of the σ is $\gamma\gamma \rightarrow \pi^0\pi^0$ at low energy

data affected by
large uncertainties

(Nguyen, Piccinini, Polosa, EPJC 47, 65 (2006))

σ meson case

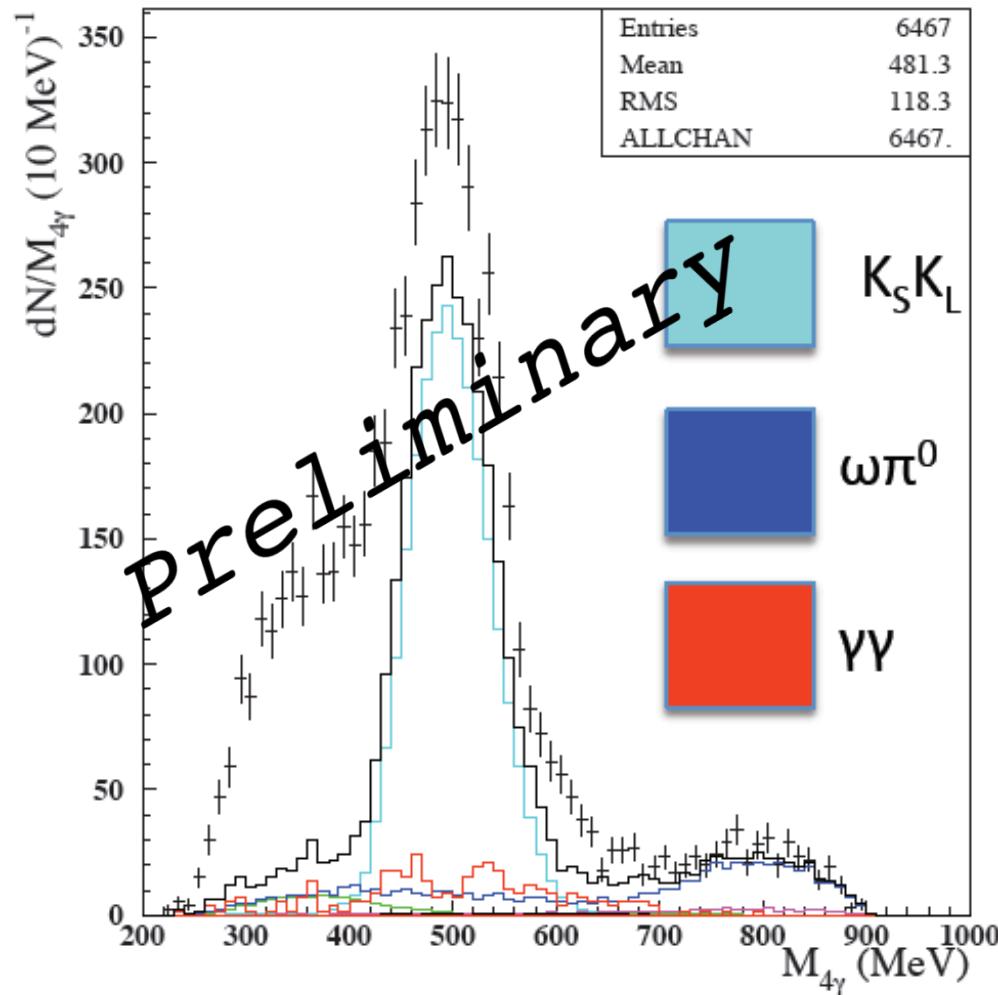

Is it difficult to extract the parameter of σ from data. Now, indications of some structure in low energy $\pi\pi$ scattering

- $\pi\pi$ amplitude contains a pole with the quantum numbers of vacuum
(Caprini, Colangelo, Leutwyler, PRL 96, 132001 (2006))

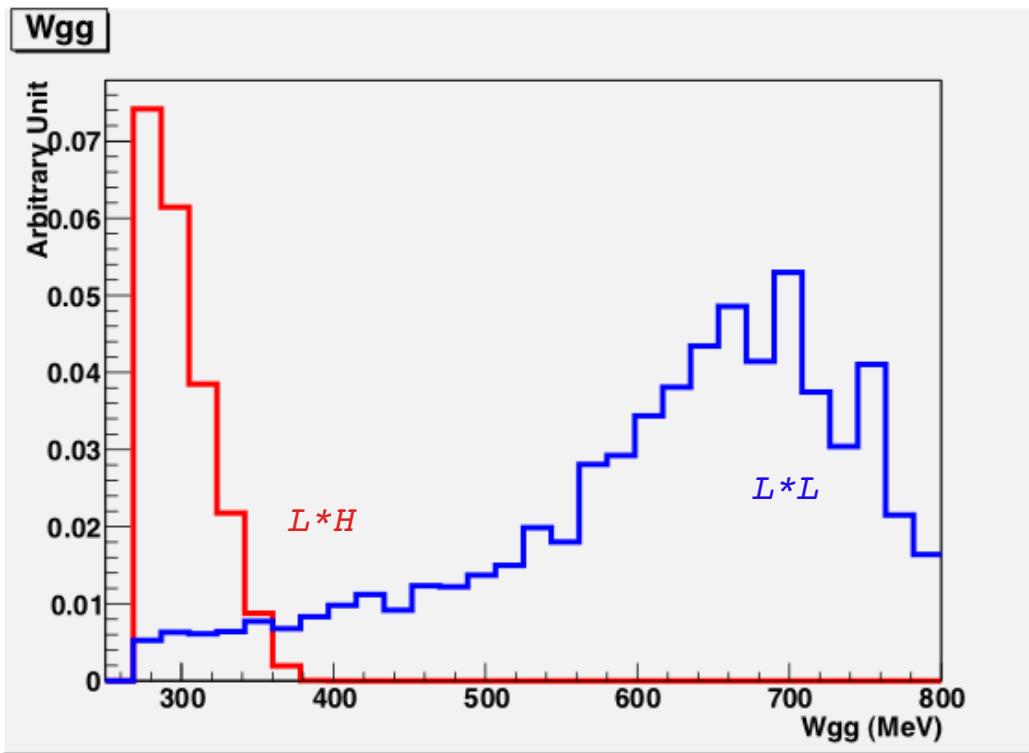

$$M_\sigma = 441^{+16}_{-8} \text{ MeV} \quad \Gamma_\sigma = 544^{+25}_{-18} \text{ MeV}$$

- $D \rightarrow 3\pi$ Dalitz plot analysis (E791) and $J/\psi \rightarrow \omega\pi^+\pi^-$ (BES)
- $\phi \rightarrow \pi^0\pi^0\gamma$ KLOE

KLOE data at $\sqrt{s}=1$ GeV

Taggers acceptance

In this study we consider only the reaction $\gamma\gamma \rightarrow \pi^0\pi^0$

- Single arm acceptance: HET = 14%, LET = 17%
- Single Total acceptance (only 1 tagger fired) = 54%
- Double arm acceptance ($H^*H + 2*L^*(H) + L^*L$) = $2+5+3 = 10\%$

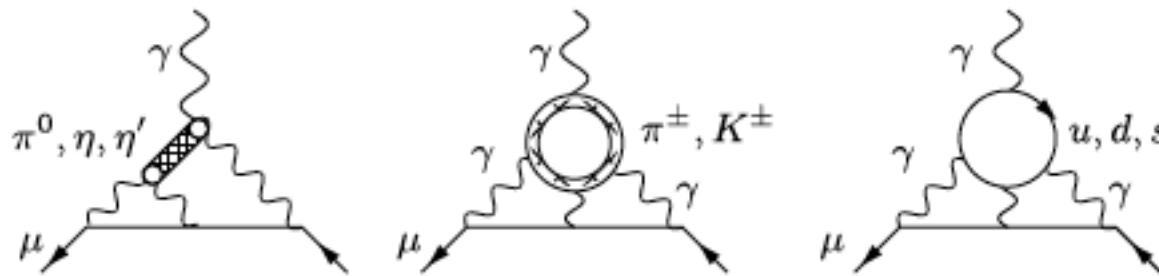

Meson transition FFs

$$e^+ e^- \rightarrow e^+ e^- M$$

$$\gamma^* \gamma \rightarrow M \rightarrow \text{Amplitude} \propto \mathcal{F}(M^2, Q^2, 0)$$

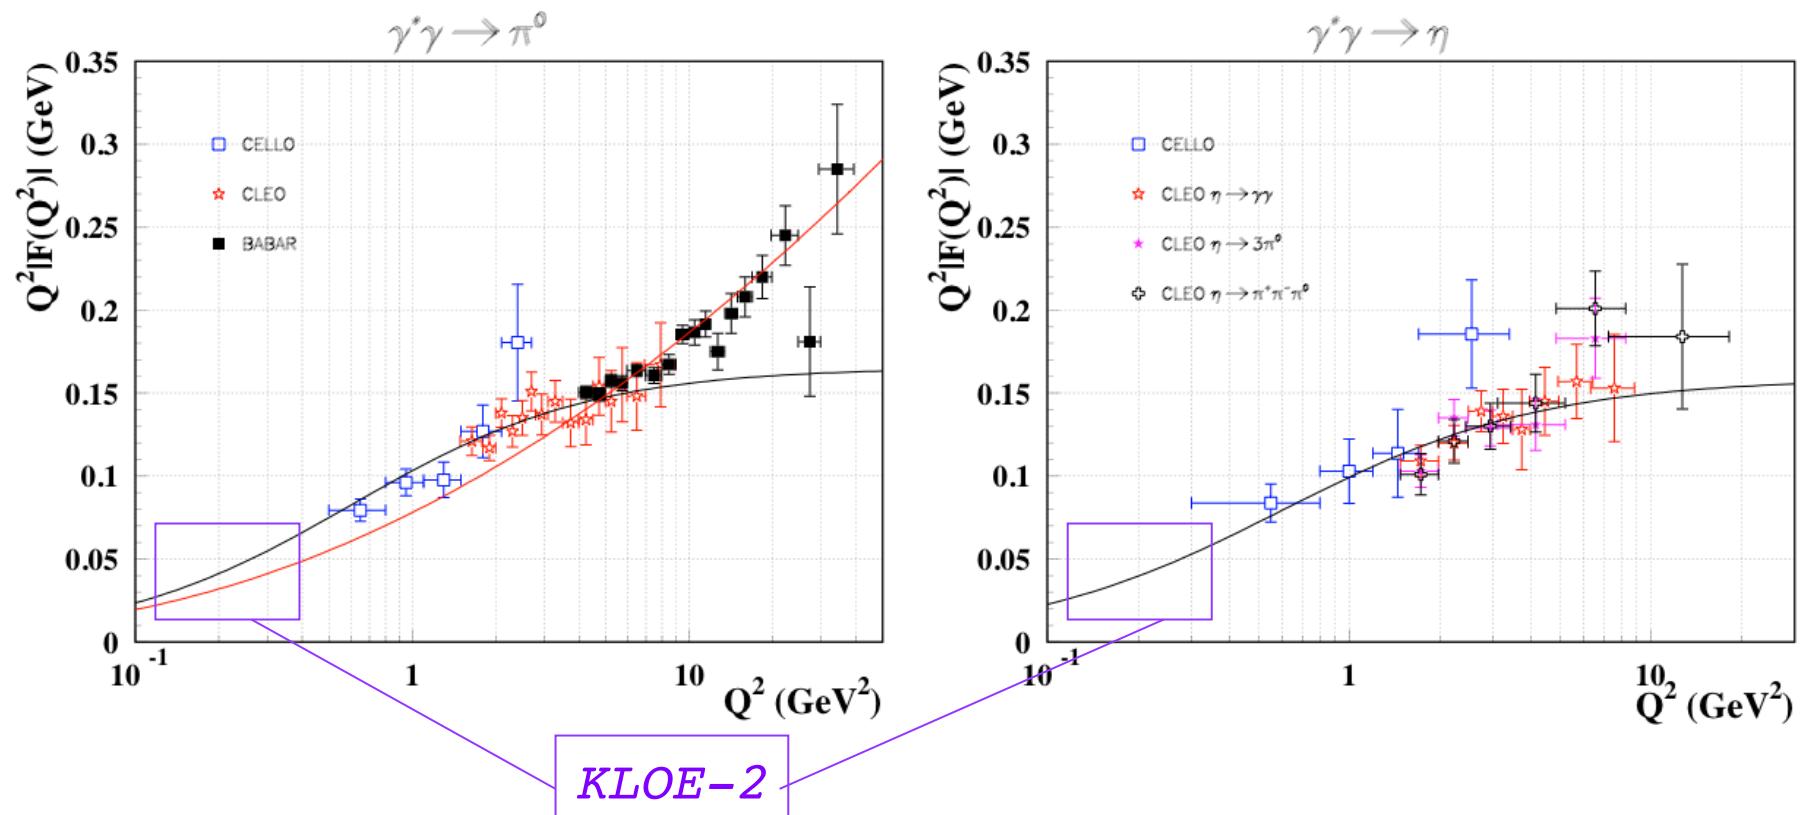

slope of \mathcal{F} near $Q^2 = 0$ crucial for hadronic LbL contribution to a_μ

F. Jegerlehner, A. Nyffeler / Physics Reports 477 (2009) 1–110

$$\begin{aligned}
 a_\mu^{\text{lbl};\pi^0} = & -e^6 \int \frac{d^4 q_1}{(2\pi)^4} \frac{d^4 q_2}{(2\pi)^4} \frac{1}{q_1^2 q_2^2 (q_1 + q_2)^2 [(p + q_1)^2 - m_\mu^2][(p - q_2)^2 - m_\mu^2]} \\
 & \times \left[\frac{\mathcal{F}_{\pi^0*\gamma^*\gamma^*}(q_2^2, q_1^2, q_3^2) \mathcal{F}_{\pi^0*\gamma^*\gamma}(q_2^2, q_2^2, 0)}{q_2^2 - m_\pi^2} T_1(q_1, q_2; p) \right. \\
 & \left. + \frac{\mathcal{F}_{\pi^0*\gamma^*\gamma^*}(q_3^2, q_1^2, q_2^2) \mathcal{F}_{\pi^0*\gamma^*\gamma}(q_3^2, q_3^2, 0)}{q_3^2 - m_\pi^2} T_2(q_1, q_2; p) \right],
 \end{aligned}$$

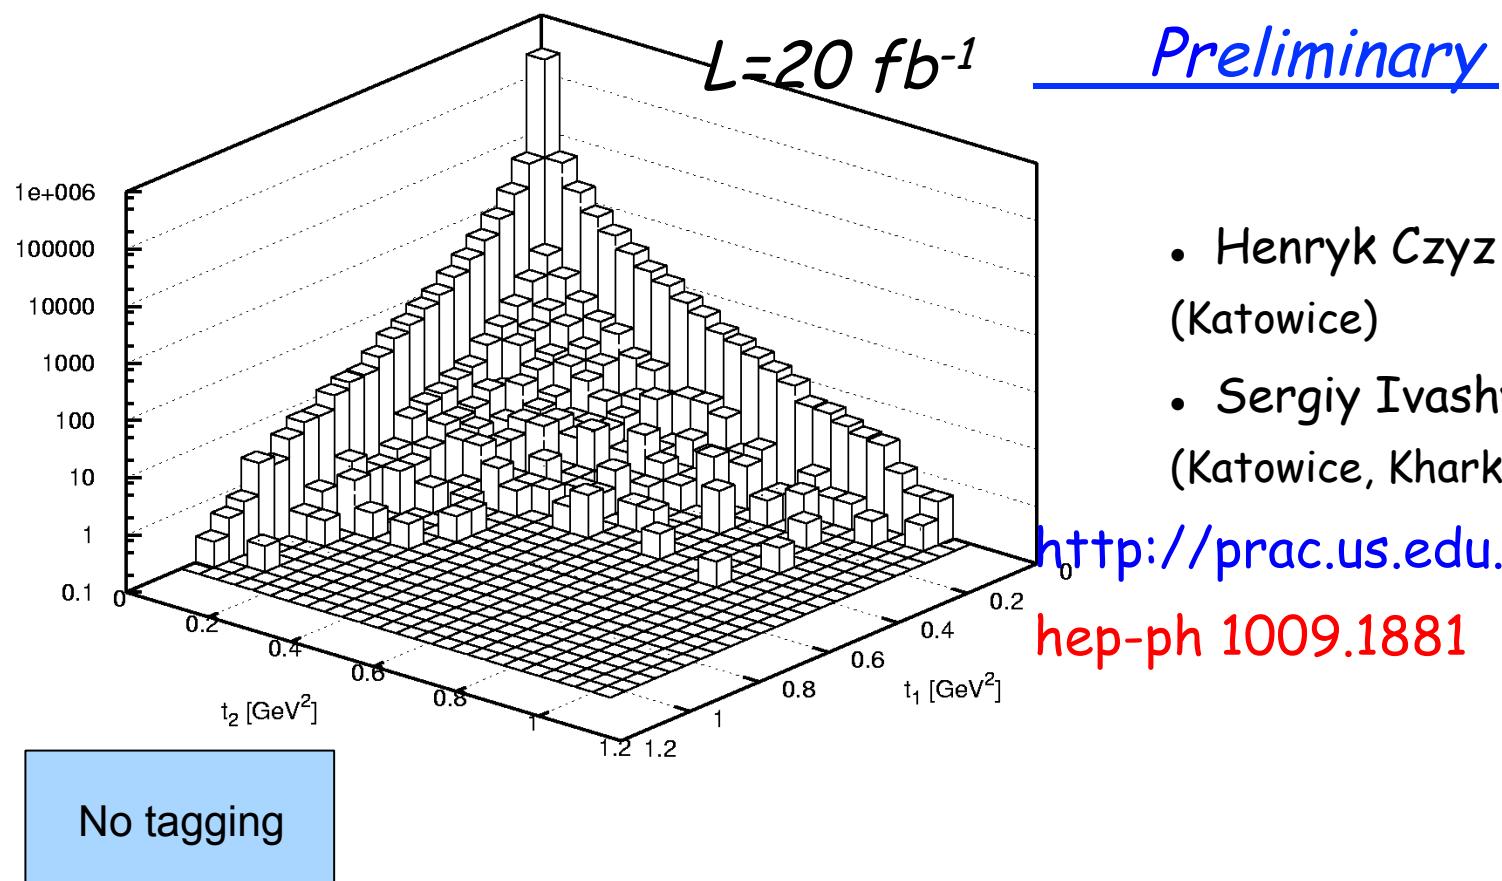

KLOE-2 contribution ??

$\gamma^*\gamma^* \rightarrow \pi^0$ from KLOE-2

studies with EKHARA Monte Carlo generator

($e^+e^- \rightarrow e^+e^-\pi^0$ added in a new version)

- Henryk Czyz
(Katowice)

- Sergiy Ivashyn
(Katowice, Kharkov)

<http://prac.us.edu.pl/~ekhara>
hep-ph 1009.1881

$\pi^0 \rightarrow \gamma\gamma$ case

WZW term

$$\frac{1}{4\pi^2 F_\pi}$$

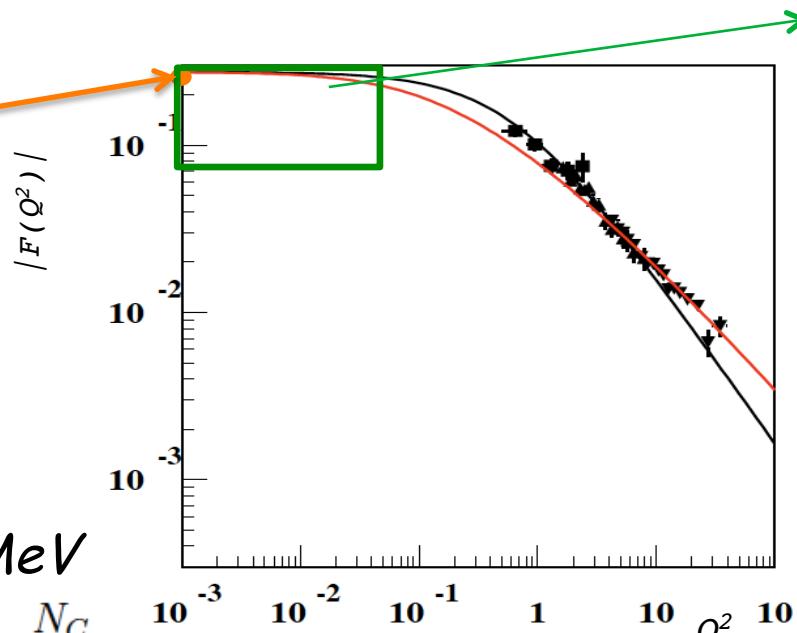

Where F_π come from $\pi \rightarrow \mu\nu(\gamma)$ decay :

$$F_\pi = 92.2 \pm 0.14 \text{ MeV}$$

$$\mathcal{F}_{\pi^0\gamma\gamma}(m_\pi^2, 0, 0) = -\frac{N_C}{12\pi^2 F_\pi}$$

$$\mathcal{F}_{\pi^0\gamma\gamma}^2(m_{\pi^0}^2, 0, 0) = \frac{1}{(4\pi\alpha)^2} \frac{64\pi\Gamma(\pi^0 \rightarrow \gamma\gamma)}{M_{\pi^0}^3}$$

If we want to use direct measure of $\Gamma(\pi^0 \rightarrow \gamma\gamma)$ then we need a error (sys + stat) better than 1 %

KLOE data will fix the slope at $Q^2=0$

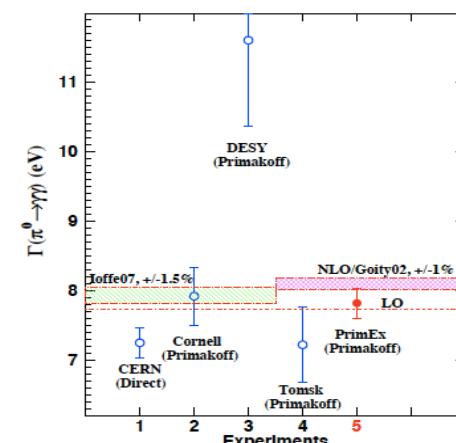

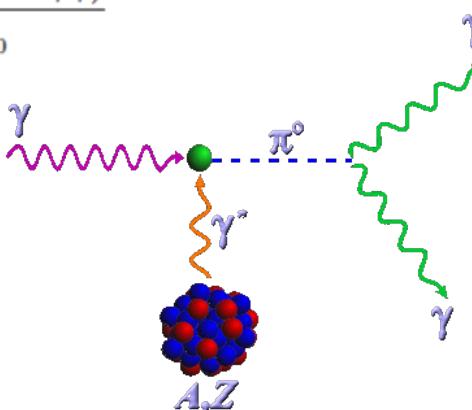

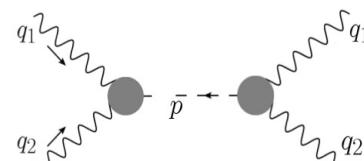

FIG. 1: $\pi^0 \rightarrow \gamma\gamma$ decay width in eV. The dashed horizontal line is the LO chiral anomaly prediction. NLO ChPT prediction [4] is shown as the shaded band on r.h.s. The l.h.s shaded band is the prediction from Ref. [7]. The experimental results, included in the PDG average, are for: (1) done with the direct method [12], (2, 3, 4) with the Primakoff method [9–11], and (5) is the current PrimEx result.

PRIMEX data

Target	$\Gamma(\pi^0 \rightarrow \gamma\gamma)$ [eV]	2.3 %
^{12}C	7.79 ± 0.18	2.3 %
^{208}Pb	7.85 ± 0.23	2.9 %

$\Gamma(\pi^0 \rightarrow \gamma\gamma)$

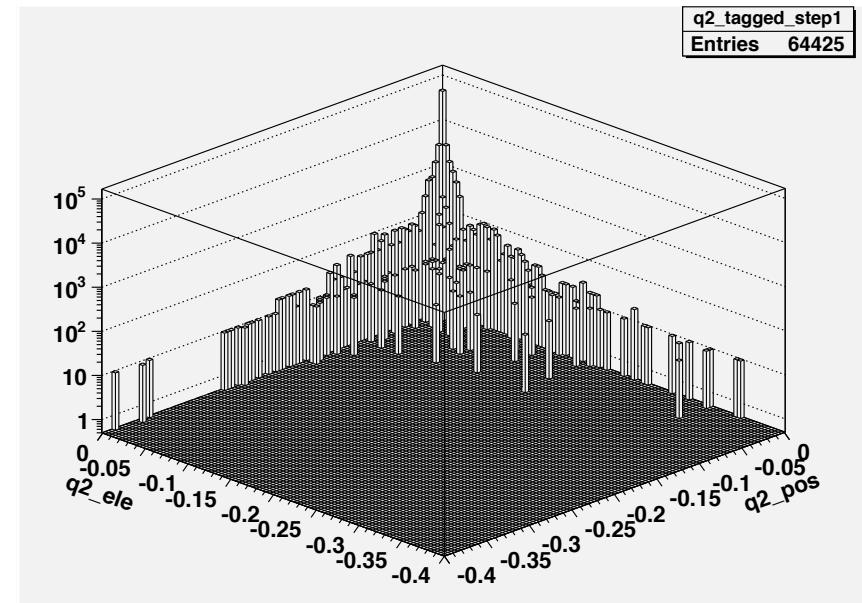

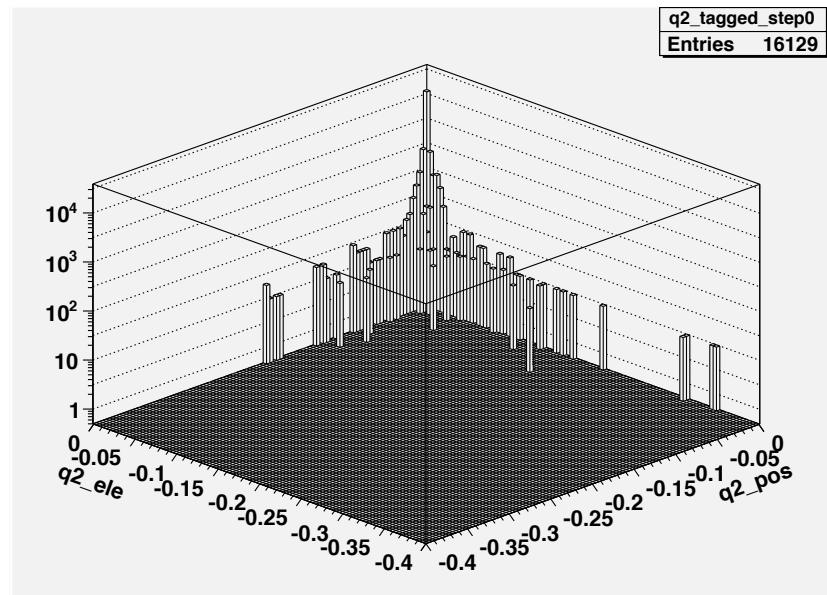

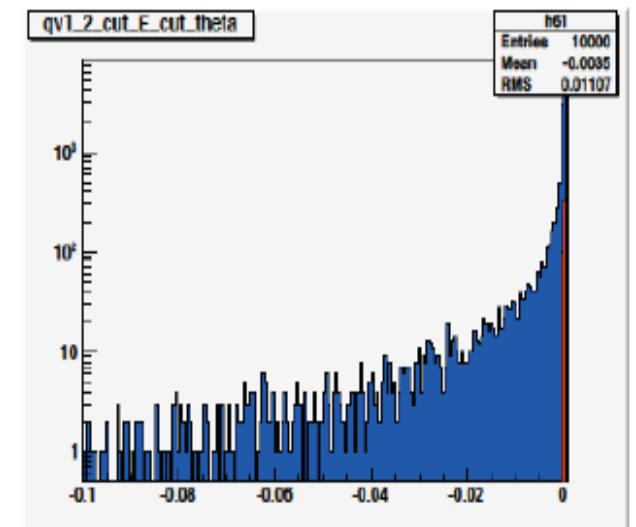

$$\mathcal{F}_{\pi^0\gamma\gamma}^2(m_{\pi^0}^2, 0, 0) = \frac{1}{(4\pi\alpha)^2} \frac{64\pi\Gamma(\pi^0 \rightarrow \gamma\gamma)}{M_{\pi^0}^3}$$

$$\sigma \approx \Gamma(\gamma^*\gamma^* \rightarrow \pi^0) \Gamma(\pi^0 \rightarrow \gamma\gamma) = \Gamma^2(\pi^0 \rightarrow \gamma\gamma)$$

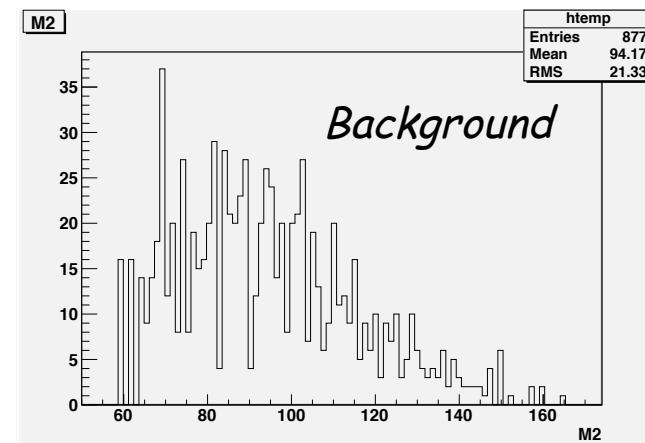

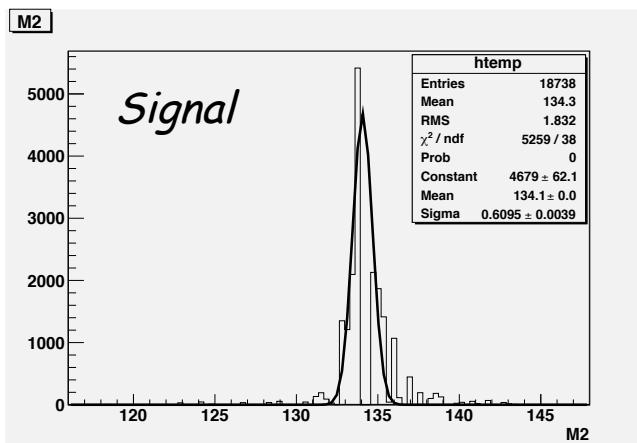

$$\sigma_{\text{tot}}(1020 \text{ MeV}) = 0.28 \text{ nb} \quad \sigma_{\text{exp}} = \sigma_{\text{tot}} * 1.9\% \text{ (H}_e^* \text{H}_e)$$

$$N_{\text{ev}} = \sigma_{\text{exp}} Q_{\text{ee}} \varepsilon_K \quad (\varepsilon_K = 37\%) \quad N_{\text{ev}} = 10000 / (5 \text{ fb}^{-1})$$

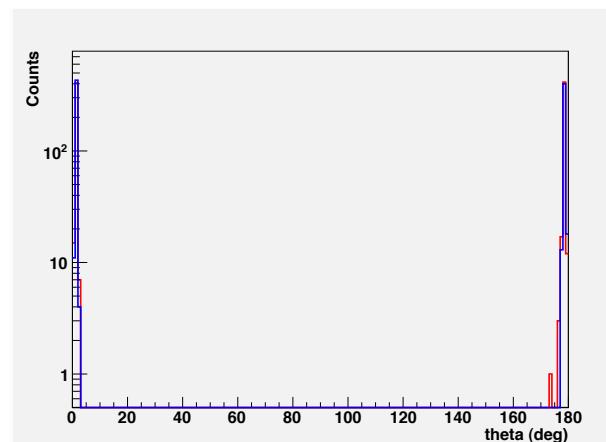

How can we improve efficiency ?

We can use HET taggers data in order to measure the missing mass of the reaction $e^+e^- \rightarrow e^+e^- X$

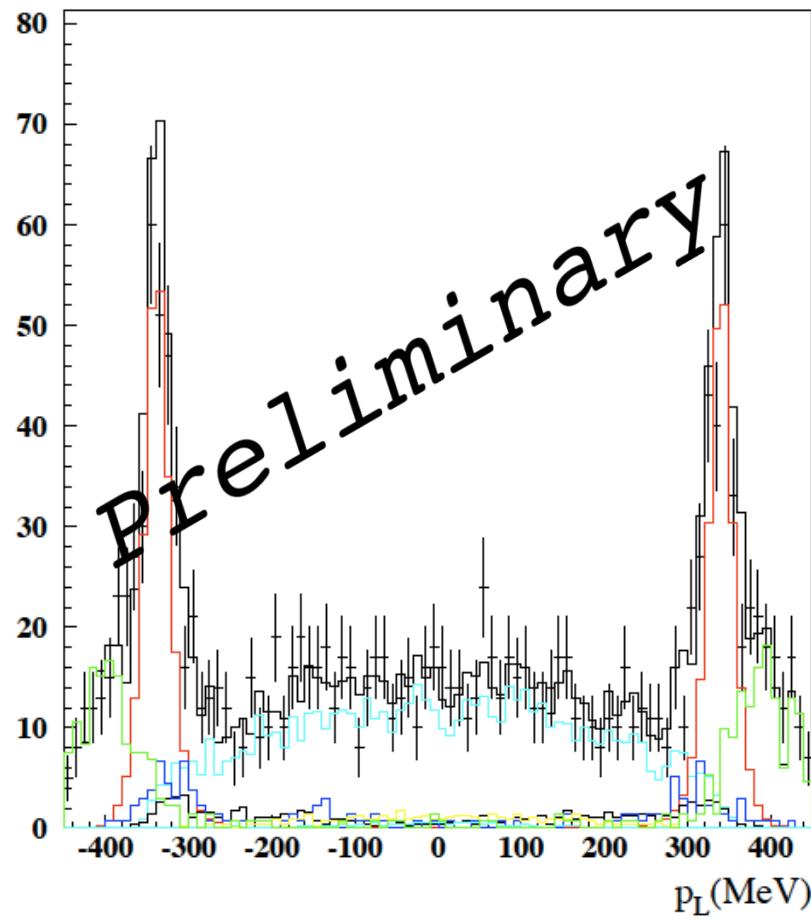

$$\frac{\text{Signal}}{\text{Background}} \sim 10^{-6}$$

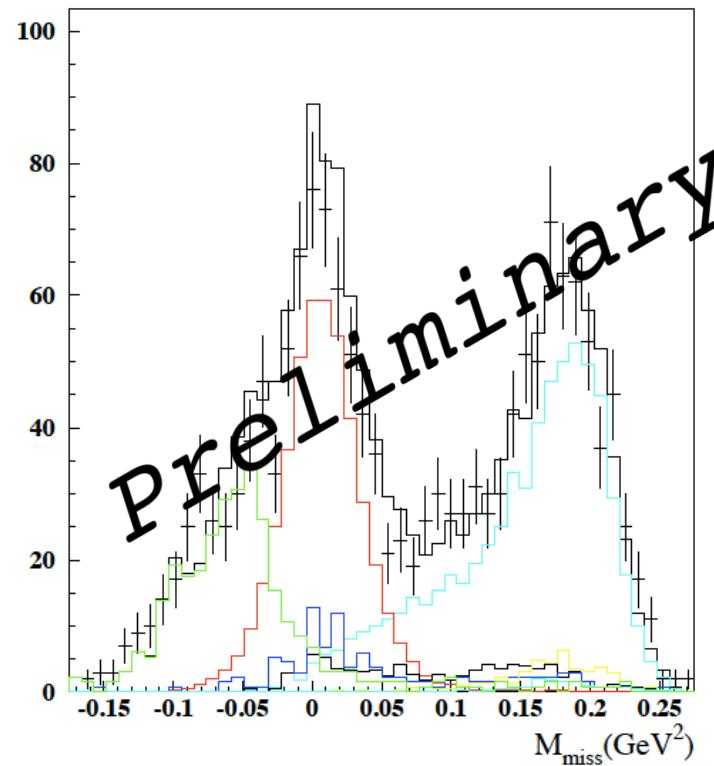

We can use
new Trigger
& DAQ
system:
 $H_1^*H_1^*K(1\gamma)$

KLOE data at $\sqrt{s}=1$ GeV

$e^+e^- \rightarrow \eta\gamma \rightarrow \pi^+\pi^-\pi^0\gamma$
 $e^+e^- \rightarrow e^+e^-\gamma$
signal

Summary

Tagging detectors ready → *LET already installed, HET : mechanics is ready, detector is ready and electronics is in commissioning phase : we plan to install HET next April*

DAΦNE : first collisions before Christmas, then we got problem in an injection magnet, collisions will restart in March/April

$\gamma\gamma$ -physics program @ KLOE-2:

- ✓ $\gamma\gamma \rightarrow \pi\pi$ *x-sect. in the low energy region → the final word (hopefully) about the σ meson;*
- ✓ π^0 and η TFFs @ very low q^2 → *consistent reduction in uncertainty of the hadronic LbL contribution to a_μ*
