1 Neutrinoless double-beta decay

2 WIMP scattering off nuclei

1 Neutrinoless double-beta decay

2 WIMP scattering off nuclei

# Double beta decay

Double beta decay is a second-order process which appears when single- $\beta$  decay is energetically forbidden or hindered by large  $\Delta J$

# Neutrinoless double beta decay

$0\nu\beta\beta$  process needs massive Majorana neutrinos ( $\nu = \bar{\nu}$ )  
 $\Rightarrow$  detection would proof Majorana nature of neutrinos

$$\left(T_{1/2}^{0\nu\beta\beta}(0^+ \rightarrow 0^+)\right)^{-1} = G_{01} |M^{0\nu\beta\beta}|^2 \left(\frac{m_{\beta\beta}}{m_e}\right)^2$$

$M^{0\nu\beta\beta}$  necessary to identify best candidates for experiment and to obtain neutrino masses and hierarchy with  $m_{\beta\beta} = \left| \sum_k U_{ek}^2 m_k \right|$

$$M^{0\nu\beta\beta} = \langle 0_f^+ | \sum_{n,m} \tau_n^- \tau_m^- \sum_X H^X(r) \Omega^X | 0_i^+ \rangle$$

- **Many-body method** to describe initial and final nuclear states
- **Transition operator**, appropriate for this decay

# Nuclear Matrix Element Uncertainty

GERDA Collaboration arXiv:1307.4720 (2013)

Nuclear Matrix Elements  
crucial to extract information  
from experiment

Different NME calculations  
give results very spread

How can we understand  
these differences?

Study transition operator and  
many-body nuclear structure

# $M^{0\nu\beta\beta}$ uncertainty: quenching

Major  $M^{0\nu\beta\beta}$  uncertainty is  $g_A$  (quenched?) value:

$$M^{0\nu\beta\beta} \propto g_A^2 \Rightarrow \left(T_{1/2}^{0\nu\beta\beta}\right)^{-1} \propto g_A^4$$

$$\mathbf{J}_{n,1B} = g_A \sigma_n \tau_n^- ,$$

$$g_A^{\text{eff}} = q g_A, \quad q \approx 0.75.$$

Theory needs to “quench”  
Gamow-Teller coupling to reproduce  
experimental lifetimes and strength  
functions where the spectroscopy is  
well reproduced

Wildenthal et al. PRC28 1343(1983)

Martínez-Pinedo et al. PRC53 2602(1996)

Bender et al. PRC65 054322(2002)

Rodríguez et al. PRL105 252503(2010)

This puzzle has been the target of many theoretical efforts:

Arima, Rho, Towner, Bertsch and Hamamoto, Wildenthal and Brown...

Revisit in the framework of (chiral EFT) currents

Transferred momenta are high in  $0\nu\beta\beta$  decay:  $p \sim 100$  MeV

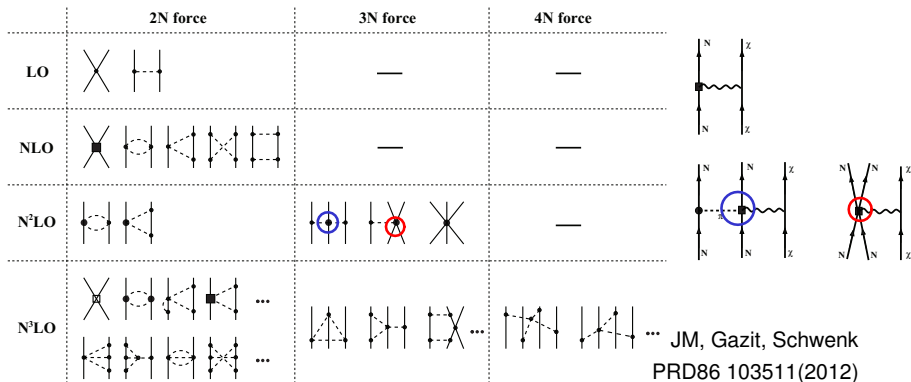

Is anything missing in the transition operator?

# Forces and Currents in Chiral EFT

Systematic expansion: nuclear forces and hadronic currents

Forces and Currents depend on same couplings

Weinberg, van Kolck, Kaplan, Savage, Epelbaum, Kaiser, Meißner...

# Hadronic 1b currents in chiral EFT

Chiral EFT provides systematic expansion of hadronic electroweak currents

Corrections to standard currents (transition operator) are more controlled than based on phenomenology

At lowest orders  $Q^0$  and  $Q^2$  there is one-body (1b) currents

Same expressions obtained using phenomenological arguments

Šimkovic et al. PRC60 055502(1999)

$$J_i^0(\mathbf{p}) = g_V(p^2)\tau^-, \quad \mathbf{J}_i(\mathbf{p}) = \left[ g_A(p^2)\boldsymbol{\sigma} - g_P(p^2)\frac{(\mathbf{p} \cdot \boldsymbol{\sigma}_i)\mathbf{p}}{2m} + i(g_M + g_V)\frac{\boldsymbol{\sigma}_i \times \mathbf{p}}{2m} \right] \tau^-,$$

$$g_V(p^2) = g_V \left( 1 - 2\frac{p^2}{\Lambda_V^2} \right), \quad g_A(p^2) = g_A \left( 1 - 2\frac{p^2}{\Lambda_A^2} \right),$$

$$g_P(p^2) = \frac{2g_{\pi pn}F_\pi}{m_\pi^2 + p^2} - 4g_A(p^2)\frac{m}{\Lambda_A^2}, \quad g_M = \kappa_p - \kappa_n = 3.70,$$

# Hadronic 2b currents in chiral EFT

At order  $Q^3$  chiral EFT  
predicts contributions from  
two-body (2b) currents

Reflect interactions  
between nucleons

Long-range currents dominant

Park et al. PRC67 055206(2003)

$$\mathbf{J}_{12}^3 = -\frac{g_A}{4F_\pi^2} \frac{1}{m_\pi^2 + k^2} \left[ 2 \left( c_4 + \frac{1}{4m} \right) \mathbf{k} \times (\boldsymbol{\sigma}_\times \times \mathbf{k}) \tau_\times^3 \right. \\ \left. + 4c_3 \mathbf{k} \cdot (\sigma_1 \tau_1^3 + \sigma_2 \tau_2^3) \mathbf{k} - \frac{i}{m} \mathbf{k} \cdot (\sigma_1 - \sigma_2) \mathbf{q} \tau_\times^3 \right]$$

Long-range currents depend on  $c_3$ ,  $c_4$  couplings of nuclear forces

Leading 2b currents are predicted

# Two-body currents in light nuclei

2b currents (Meson-exchange currents)

needed to reproduce data in *ab initio* calculations of light nuclei:

$^3\text{H}$   $\beta$  decay

Gazit, Quaglioni, Navrátil

PRL103 102502(2009)

$A \leq 9$  magnetic moments

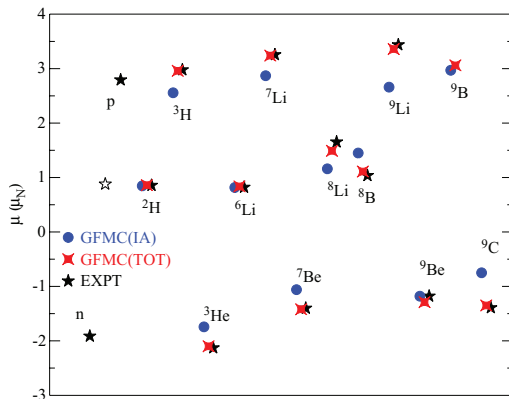

Pastore et al. PRC87 035503(2013)

$^3\text{H}$   $\mu$  capture

Gazit PLB666 472(2008)

Marcucci et al. PRC83 014002(2011)

2b current contributions  $\sim$  few % in light nuclei ( $Q \sim \sqrt{BEm}$ )

2b currents order  $Q^3 \Rightarrow$  larger effect in medium-mass nuclei ( $Q \sim k_F$ )

## 2b currents: normal-ordering

Approximate in medium-mass nuclei:  
normal-ordered 1-body part with respect to spin/isospin symmetric Fermi gas

Sum over one nucleon, direct and the exchange terms

$\Rightarrow \mathbf{J}_{n,2b}^{\text{eff}}$ , normal-ordered  
(effective) one-body current

Corrections  $\sim (n_{\text{valence}}/n_{\text{core}})$   
in Fermi systems

## 2b currents: normal-ordering

Approximate in medium-mass nuclei:

normal-ordered 1-body part with respect to spin/isospin symmetric Fermi gas

Sum over one nucleon, direct and the exchange terms

$\Rightarrow \mathbf{J}_{n,2b}^{\text{eff}}$ , normal-ordered  
(effective) one-body current

Corrections  $\sim (n_{\text{valence}}/n_{\text{core}})$   
in Fermi systems

The normal-ordered two-body currents modify GT operator

$$\mathbf{J}_{n,2b}^{\text{eff}} = -\frac{g_A \rho}{f_\pi^2} \tau_n^- \sigma_n \left[ \frac{2}{3} c_3 \frac{\mathbf{p}^2}{4m_\pi^2 + \mathbf{p}^2} + l(\rho, P) \left( \frac{1}{3} (2c_4 - c_3) + \frac{1}{6m_N} \right) \right],$$

long-range  $p$  dependent

long-range  $p$  independent

# Contribution of 2b currents

2b currents at  $\rho = 0$ : GT decays,  $2\nu\beta\beta$  decay

$$\mathbf{J}_{n,2b}^{\text{eff}} = -\frac{g_A \rho}{f_\pi^2} \tau_n^- \sigma_n \left[ I(\rho, P) \left( \frac{1}{3} (2c_4 - c_3) + \frac{1}{6m_N} \right) \right],$$

JM, Gazit, Schwenk PRL107 062501 (2011)

General density range

$$\rho = 0.10 \dots 0.12 \text{ fm}^{-3}$$

Couplings  $c_3, c_4$  from NN potentials

Entem et al. PRC68 041001(2003)

Epelbaum et al. NPA747 362(2005)

Rentmeester et al. PRC67 044001(2003)

$$\delta c_3 = -\delta c_4 \approx 1 \text{ GeV}^{-1}$$

2b currents predict  $g_A$  quenching  $q = 0.85 \dots 0.66$

# Transferred-momentum dependence

The  $\sigma_{T^-}$  term depends on transferred momentum  $p$ :

$$-\frac{g_{A\rho}}{f_\pi^2} \tau_n^- \sigma_n \frac{2}{3} c_3 \frac{\mathbf{p}^2}{4m_\pi^2 + \mathbf{p}^2}$$

JM, Gazit, Schwenk PRL107 062501 (2011)

Quenching reduced at  $p > 0$ , relevant for  $0\nu\beta\beta$  decay where  $p \sim m_\pi$

# Nuclear Structure approach

Big variety of nuclei in the nuclear chart,  $A \sim 2 \dots 300$

Systematic *ab initio* calculations only possible in the lightest nuclei

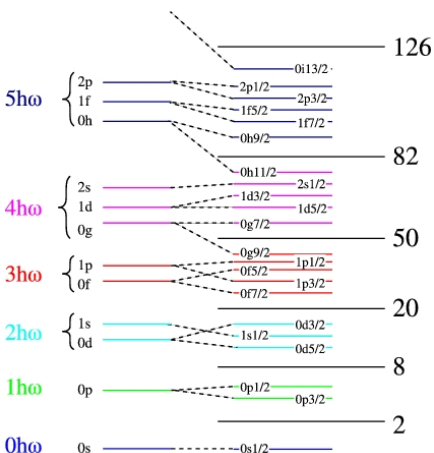

Poses a hard many-body problem: design approximate methods suited for different regions

## Interacting Shell Model:

Solve the problem choosing the (more) relevant degrees of freedom

Use realistic nucleon-nucleon (NN) and three-nucleon (3N) interactions

# The Interacting Shell Model

Chose as basis states that of the 3D Harmonic Oscillator

To keep the problem feasible, the configuration space is separated into

- Outer orbits: orbits that are always empty
- Valence space: the space in which we explicitly solve the problem
- Inner core: orbits that are always filled

$$\text{Dim} \sim \binom{(\rho+1)(\rho+2)_\nu}{N} \binom{(\rho+1)(\rho+2)_\pi}{Z}$$

# Solving the Schrödinger equation

Now, we have to solve the nuclear problem in the valence space,

$$H|\Psi\rangle = E|\Psi\rangle \rightarrow H_{\text{eff}}|\Psi\rangle_{\text{eff}} = E|\Psi\rangle_{\text{eff}}$$

where  $H_{\text{eff}}$  is obtained in many-body perturbation theory includes the effect of inner core and outer orbits

The many body wave function will be a linear combination of the Slater Determinants built upon these single particle states

$$|\phi_\alpha\rangle = a_{i_1}^+ a_{i_2}^+ \dots a_{i_A}^+ |0\rangle \quad |\Psi\rangle_{\text{eff}} = \sum_{\alpha} c_{\alpha} |\phi_{\alpha}\rangle$$

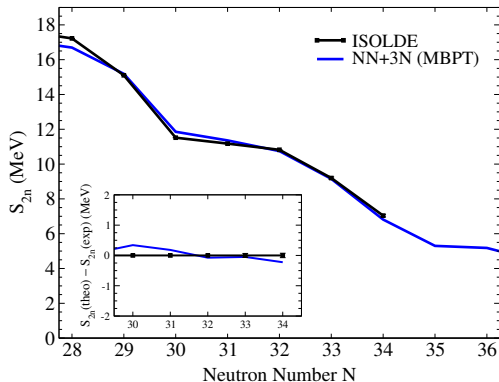

The ISM codes Antoine/Nathan diagonalize up to  $10^{10}$  Slater determinants

Caurier *et al.* RMP 77 (2005)

# Nuclear Structure with Chiral EFT: calcium

Ca isotopes (on top of  $^{40}\text{Ca}$  core)

Compare  $S_{2n} = -[B(N, Z) - B(N - 2, Z)]$  with experiment

Gallant et al. PRL 109 032506 (2012)

Wienholtz et al. Nature 498 346 (2013)

Precision measurements  
with TITAN changed AME  
2003  $\sim 1.74$  MeV in  $^{52}\text{Ca}$

Very recently  $^{53,54}\text{Ca}$   
measured at ISOLDE:  
 $N = 32$  magic number

Excellent agreement between  
calculation and experiment  
(Similar to phenomenological  
ISM interactions)

# Nuclear Structure with Chiral EFT: calcium

Ca isotopes (on top of  $^{40}\text{Ca}$  core)

Compare  $S_{2n} = -[B(N, Z) - B(N - 2, Z)]$  with experiment

Gallant et al. PRL 109 032506 (2012)

Wienholtz et al. Nature 498 346 (2013)

Excellent agreement between  
calculation and experiment  
(Similar to phenomenological  
ISM interactions)

# Calculation of $0\nu\beta\beta$ initial and final states

- **Shell Model (SM) code Nathan** Caurier *et al.* RMP77 427(2005)  
State-of-the-art description of initial and final states  
by diagonalization of the full valence space
- **SM interactions** based on  $G$  matrices + MBPT (core polarization) with  
phenomenological monopole modifications
- The **valence spaces** and interactions used are the following
  - $pf$  shell for  $^{48}\text{Ca}$   
KB3 interaction
  - $1p_{3/2}$ ,  $0f_{5/2}$ ,  $1p_{1/2}$  and  $0g_{9/2}$  space for  $^{76}\text{Ge}$  and  $^{82}\text{Se}$   
gcn.2850 interaction
  - $0g_{7/2}$ ,  $1d_{3/2}$ ,  $1d_{5/2}$ ,  $2s_{1/2}$  and  $0h_{11/2}$  space  
for  $^{124}\text{Sn}$ ,  $^{130}\text{Te}$  and  $^{136}\text{Xe}$   
gcn.5082 interaction

# Test of nuclear structure: occupancies of $^{76}\text{Ge}$ , $^{76}\text{Se}$

Experimental occupancies are well described!

Calculations using state-of-the-art ISM interactions and valence spaces (NATHAN code)

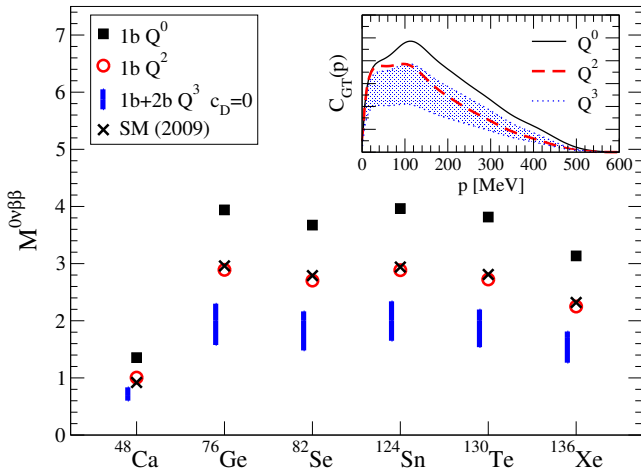

$$M^{0\nu\beta\beta} =$$

2.81 (GCN)  
3.26 (RG)

Experiment: Schiffer et al. PRL100 112501(2009), Kay et al. PRC79 021301(2009)

Theory: JM, Caurier, Nowacki, Poves PRC80 048501 (2009)

# Nuclear Matrix Elements for $0\nu\beta\beta$ decay

JM, Gazit, Schwenk PRL107 062501 (2011)

Order  $Q^0+Q^2$  similar to calculations with phenomenological currents

JM, Poves, Caurier, Nowacki NPA818 139 (2009)

At order  $Q^3$  2b currents reduce  $\sim 15\% - 40\%$  the NME

Smaller than -45% ( $q^2 = 0.75^2$ ) due to momentum-transfer  $p > 0$

2b currents to be included by any many-body method computing  $0\nu\beta\beta$  decay

# $M^{0\nu\beta\beta}$ uncertainty: nuclear structure

Different calculations differ factor  $\sim 2$  remain:  
Correction to the transition operator affect all NME calculations

ISM and EDF very different results

How can we understand these differences?

Gomez-Cadenas et al., JCAP06 007(2011)

# Non-physical transitions (except $^{48}\text{Ca}$ ) in the $pf$ shell

## Non-physical transitions in the $pf$ shell

- ISM and EDF very well tested in this region
- ISM calculation with spin-orbit partners (Ikeda Sum Rule fulfilled)

## Gamow-Teller part of the NME: $M_{GT}^{0\nu\beta\beta}$

- Dominant part of the NME
- Avoids problems with good isospin in EDF ( $M_F^{0\nu\beta\beta}$  overestimated)

## Study different decay chains:

- $\text{Ca} \rightarrow \text{Ti}$ ,  $\text{Ti} \rightarrow \text{Cr}$ ,  $\text{Cr} \rightarrow \text{Fe}$ ,  $\text{Fe} \rightarrow \text{Ni}$
- Protons expected to be dominantly in the  $f_{7/2}$  orbital
- Neutrons lighter isotopes mainly  $f_{7/2}$  orbital,  
in heavier isotopes also  $p_{3/2}$ ,  $p_{1/2}$  and  $f_{5/2}$  orbitals

# NME systematics in the $pf$ shell

Trends in  $M_{GT}^{0\nu\beta\beta}$ , related to structure:  
closed shells, mirror nuclei  
similarly reproduced

In same region, relative matrix  
elements better constrained

ISM systematically below EDF  
for any nuclear interaction

# NME systematics in the $pf$ shell

Trends in  $M_{GT}^{0\nu\beta\beta}$ , related to structure:  
closed shells, mirror nuclei  
similarly reproduced

In same region, relative matrix  
elements better constrained

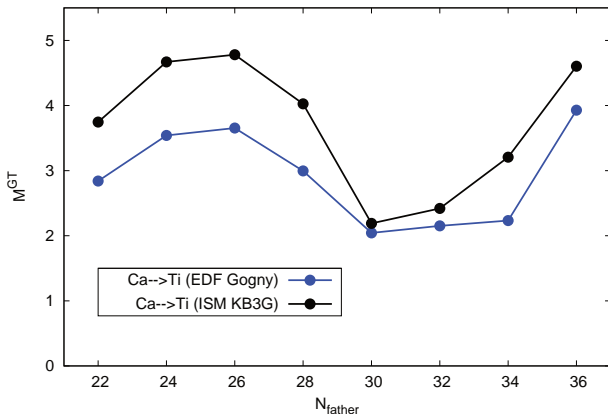

ISM systematically below EDF  
for any nuclear interaction

# NME systematics in the $pf$ shell: spherical case

## Non-realistic spherical initial and final states:

- ISM: zero seniority: all particles forming  $J = 0$  pairs
- EDF: only spherical contributions

Same behaviour in ISM and EDF calculations

NME scale set by pairing content of nuclear interaction

KB3G bigger NMEs than EDF!

# NME systematics in the $pf$ shell: spherical case

## Non-realistic spherical initial and final states:

- ISM: zero seniority: all particles forming  $J = 0$  pairs
- EDF: only spherical contributions

Same behaviour in ISM and EDF calculations

NME scale set by pairing content of nuclear interaction

KB3G bigger NMEs than EDF!

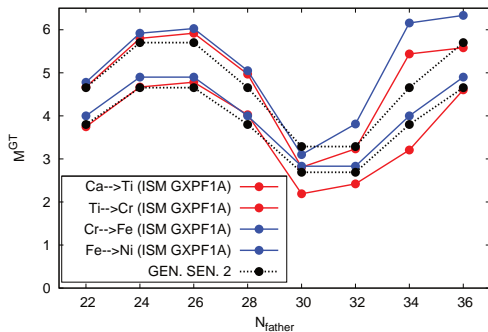

GXPF1A almost perfect agreement with EDF!

# Spherical NMEs and generalized seniority model

ISM and EDF agree in  $M_{GT}^{0\nu\beta\beta}$  in the spherical limit (no correlations)

Predicted by generalized seniority model Barea, Iachello PRC79 044301(2009)

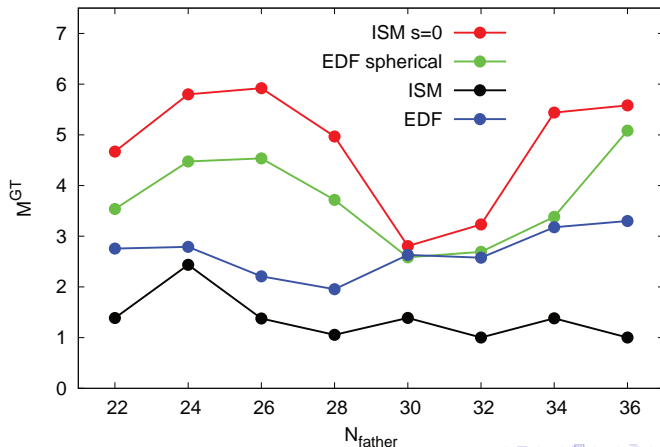

$$M_{GT}^{0\nu\beta\beta} \simeq \alpha_\pi \alpha_\nu \sqrt{N_\pi + 1} \sqrt{\Omega_\pi - N_\pi} \sqrt{N_\nu} \sqrt{\Omega_\nu - N_\nu + 1}$$

# Seniority evolution of matrix elements

ISM and EDF agree in  $M_{GT}^{0\nu\beta\beta}$  in the spherical limit

Difference lies in the treatment of correlations

# Seniority evolution of matrix elements

ISM and EDF agree in  $M_{GT}^{0\nu\beta\beta}$  in the spherical limit

Difference lies in the treatment of correlations

# $^{50}\text{Ca} \rightarrow ^{50}\text{Ti}$ (non-physical) decay

In the ISM, high seniority components in initial and (mostly) final states allow the decay of  $J^P$  pairs other than  $0^+$

As a consequence Nuclear Matrix Elements are reduced

1 Neutrinoless double-beta decay

2 WIMP scattering off nuclei

# Dark Matter: evidence

Solid evidence of Dark Matter  
in very different observations:

Rotation curves, Lensing, CMB...  
Zwicky 1930's, Rubin 1970's, ..., Planck (2013)

# What is Dark Matter?: WIMPs

We don't know the component of Dark Matter

Many very different candidates have been proposed:

New particles: To be detected

- **Weakly interacting massive particles (WIMPs)**
- Sterile neutrinos
- Axions
- Gravitons
- ...

Lightest supersymmetric particles (usually neutralino) predicted in SUSY extensions of the Standard Model

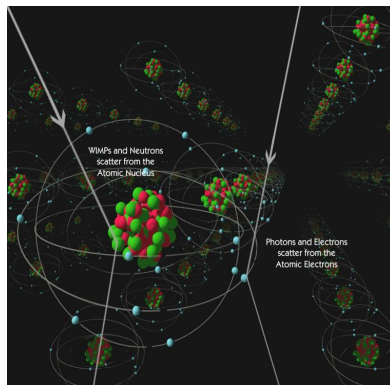

Expected WIMP-density naturally accounts observed Dark Matter density

# WIMP scattering off nuclei

We need Nuclear Matrix Elements for WIMP scattering off nuclei

$$\langle \text{Initial} | \mathcal{L}_{\text{leptons-nucleons}} | \text{Final} \rangle = \langle \text{Initial} | \int dx j^\mu(x) J_\mu(x) | \text{Final} \rangle$$

- Nuclear structure calculation of the initial and final states: State-of-the-art Shell Model diagonalizations and interactions
- Description of the lepton-nucleus interaction: Evaluation (non-perturbative) of the hadronic currents inside nucleus

CDMS Collaboration

# Spin-Independent vs Spin-Dependent

## Spin-Independent interaction:

WIMPs couple to the nuclear density

Coherent sum over nucleons and protons in the nucleus

$$\sigma \propto |\langle \text{Initial} | \int dx j^\mu(x)^{SI} J_\mu(x)^{SI} | \text{Final} \rangle|^2 \propto \left| \sum_{N,Z} c_0 \right|^2 \propto c_0^2 A^2$$

## Spin-Dependent interaction:

WIMP spins couple to the nuclear spin

Pairing interaction: pairs of spins couple to  $S = 0$ :  
no coherence

Only stable nuclei with odd neutrons/protons  
relevant for experiment searches

Specially sensitive to nuclear structure,  
distribution of spin among nucleons

# 1b hadronic currents

At lowest orders in chiral EFT, 1-body current

$$Q^0 : \sum_{i=1}^A \mathbf{J}_{i,1b} = \sum_{i=1}^A \frac{1}{2} \left[ a_0 \sigma_i + a_1 \tau_i^3 \sigma_i \right],$$

$$Q^2 : \sum_{i=1}^A \mathbf{J}_{i,1b} = \sum_{i=1}^A \frac{1}{2} \left[ a_0 \sigma_i + a_1 \tau_i^3 \left( \frac{g_A(p^2)}{g_A} \sigma_i - \frac{g_P(p^2)}{2mg_A} (\mathbf{p} \cdot \sigma_i) \mathbf{p} \right) \right],$$

where  $a_0/a_1$  are the **isoscalar/isovector** couplings

$Q^2$  1b currents correspond to standard phenomenological currents, slightly different  $p$ -dependence consistent with chiral EFT expansion

Engel et al. IJMPE1 1(1992)

# 2b currents: normal-ordering

## $Q^3$ : 2b currents

Approximate in medium-mass nuclei: normal-ordered 1-body part with respect to spin/isospin symmetric Fermi gas

$$\mathbf{J}_{12}^3 = -\frac{g_A}{4F_\pi^2} \frac{1}{m_\pi^2 + k^2} \left[ 2 \left( c_4 + \frac{1}{4m} \right) \mathbf{k} \times (\boldsymbol{\sigma}_\times \times \mathbf{k}) \tau_\times^3 + 4c_3 \mathbf{k} \cdot (\sigma_1 \tau_1^3 + \sigma_2 \tau_2^3) \mathbf{k} - \frac{i}{m} \mathbf{k} \cdot (\sigma_1 - \sigma_2) \mathbf{q} \tau_\times^3 \right]$$

Sum over one nucleon, direct and the exchange terms

$\Rightarrow \mathbf{J}_{n,2b}^{\text{eff}}$ , normal-ordered  
(effective) one-body current

Corrections  $\sim (n_{\text{valence}}/n_{\text{core}})$   
in Fermi systems

# Normal-ordered 2b currents

The leading (long-range) normal-ordered two-body currents are

$$\mathbf{J}_{i,2b}^{\text{eff}} = -g_A \frac{\tau_i^3}{2} \frac{\rho}{F_\pi^2} I(\rho, P=0) \left( \frac{1}{3}(2c_4 - c_3) + \frac{1}{6m} \right) \sigma_i = -g_A \frac{\tau_i^3}{2} \delta a_1 \sigma_i$$

$$\mathbf{J}_{i,2b}^{\text{eff}, P} = -g_A \frac{\tau_i^3}{2} \frac{\rho}{F_\pi^2} 2c_3 \frac{1}{4m_\pi^2 + p^2} (\mathbf{p} \cdot \sigma_i) \mathbf{p} = -g_A \frac{\tau_i^3}{2} \frac{\delta a_1^P(p^2)}{p^2} (\mathbf{p} \cdot \sigma_i) \mathbf{p}$$

Low-energy couplings  $c_i$  from nuclear forces

Range of nuclear densities  $\rho = 0.10 \dots 0.12 \text{ fm}^{-3}$

	$c_3$	$c_4$	$\delta a_1$	$\delta a_1^P(p = m_\pi)$
EM	-3.2	5.4	-(0.25...0.32)	0.12...0.14
EM+ $\delta c_i$	-2.2	4.4	-(0.20...0.25)	0.08...0.10
EGM	-3.4	3.4	-(0.19...0.23)	0.12...0.15
EGM+ $\delta c_i$	-2.4	2.4	-(0.13...0.17)	0.09...0.10
PWA	-4.78	3.96	-(0.23...0.29)	0.17...0.21
PWA+ $\delta c_i$	-3.78	2.96	-(0.18...0.22)	0.14...0.16

2b currents: renormalization of the isovector couplings

axial (reduction) and pseudoscalar (enhancement)

# Nuclear Structure calculations

- Nuclear interactions based on NN interactions + many-body perturbation theory + phenomenological modifications (to compensate for absence of 3N forces)
- The valence spaces and interactions used are the following
  - $0g_{7/2}$ ,  $1d_{3/2}$ ,  $1d_{5/2}$ ,  $2s_{1/2}$  and  $0h_{11/2}$  space for  $^{127}\text{I}$ ,  $^{129}\text{Xe}$  and  $^{131}\text{Xe}$   
gcn.5082 interaction
  - $1p_{3/2}$ ,  $0f_{5/2}$ ,  $1p_{1/2}$  and  $0g_{9/2}$  space for  $^{73}\text{Ge}$   
gcn.2850, rg interactions
  - $sd$  shell for  $^{19}\text{F}$ ,  $^{23}\text{Na}$ ,  $^{27}\text{Al}$ ,  $^{29}\text{Si}$   
usdb interaction
- These valence spaces and interactions have been tested in nuclear structure,  $\beta$  and  $\beta\beta$  decay studies

# $^{129,131}\text{Xe}$ spectra

The agreement with experimental spectra is very good!

JM, Gazit, Schwenk PRD86 103511(2012)

Ordering and grouping of states well reproduced

# Spin-dependent WIMP-nucleus scattering

## Spin-Dependent WIMP-nucleus scattering $\Rightarrow$ odd- $A$ nuclei

The interaction Hamiltonian has a leptonic current (neutralino) and a hadronic current (nucleons in the nucleus)

$$\langle f | \mathcal{L}_\chi^{SD} | i \rangle = -\frac{G_F}{\sqrt{2}} \int d^3\mathbf{r} \mathbf{j}_{fi}(\mathbf{r}) \mathbf{J}_{fi}^A(\mathbf{r}) = -\frac{G_F}{\sqrt{2}} \int d^3\mathbf{r} e^{-i\mathbf{p}\cdot\mathbf{r}} \bar{\chi} \gamma \gamma_5 \chi \mathbf{J}_{fi}^A(\mathbf{r})$$

Assuming non-relativistic ( $v/c \sim 10^{-3}$ ) WIMPs with spin 1/2 the scattering cross-section is related to the Structure Factor  $S(\mathbf{p})$

$$\frac{d\sigma}{d\mathbf{p}} \propto \frac{1}{2} \sum_{S_i, S_f} \frac{1}{2J_i + 1} \sum_{M_i, M_f} |\langle f | \mathcal{L}_\chi^{SD} | i \rangle|^2 = G_F^2 \frac{4\pi}{2J_i + 1} \mathbf{S}_A(\mathbf{p})$$
$$\mathbf{S}_A(\mathbf{p}) = \sum_L \left( |\langle J_f || \mathcal{T}_L(\mathbf{p}) || J_i \rangle|^2 + |\langle J_f || \mathcal{M}_L(\mathbf{p}) || J_i \rangle|^2 + |\langle J_f || \mathcal{L}_L(\mathbf{p}) || J_i \rangle|^2 \right)$$

Multipoles:    Trans. Electric    Trans. Magnetic    Longitudinal

# Structure Factors with 1b currents

In  $^{129,131}_{54}\text{Xe}$   $\langle S_n \rangle \gg \langle S_p \rangle$ , 

$$S_p = \sum_{i=1}^Z \sigma_i / 2, \quad S_n = \sum_{i=1}^N \sigma_i / 2$$

At  $p = 0$  “Neutron”/“Proton” couplings maximize/minimize  $S_A$ :

$$S_A = \frac{(2J+1)(J+1)}{\pi J} |a_p \langle S_p \rangle + a_n \langle S_n \rangle|^2,$$

$$a_{n/p} = (a_0 \mp a_1) / 2,$$

$$S_n(0) \propto |\langle S_n \rangle|^2 \quad S_p(0) \propto |\langle S_p \rangle|^2.$$

# 1b+2b currents: multipole decomposition

The multipoles, with the contributions from 1b+2b currents are

$$\mathcal{T}_L(p) = \frac{1}{\sqrt{2L+1}} \sum_{i=1}^A \frac{1}{2} \left[ a_0 + a_1 \tau_i^3 \left( 1 - 2 \frac{p^2}{\Lambda_A^2} + \delta a_1 \right) \right] \\ \times \left[ -\sqrt{L} M_{L,L+1}(p\mathbf{r}_i) + \sqrt{L+1} M_{L,L-1}(p\mathbf{r}_i) \right]$$

$$\mathcal{L}_L(p) = \frac{1}{\sqrt{2L+1}} \sum_{i=1}^A \frac{1}{2} \left[ a_0 + a_1 \tau_i^3 \left( 1 + \delta a_1 - \frac{2g_{\pi pn} F_{\pi} p^2}{2mg_A(m_{\pi}^2 + p^2)} + \delta a_1^P(p) \right) \right] \\ \times \left[ \sqrt{L+1} M_{L,L+1}(p\mathbf{r}_i) + \sqrt{L} M_{L,L-1}(p\mathbf{r}_i) \right],$$

$$\mathcal{M}_L(p) = \sum_{i=1}^A \frac{1}{2} \left[ a_0 + a_1 \tau_i^3 \left( 1 - 2 \frac{p^2}{\Lambda_A^2} + \delta a_1 \right) \right] M_{L,L}(p\mathbf{r}_i), \text{ with } M_{L,L'}(p\mathbf{r}_i) = j_{L'}(p\mathbf{r}_i) [Y_{L'}(\hat{\mathbf{r}}_i) \sigma_i]^L.$$

⇒ Reduction in the isovector response due to  $\delta a_1$ : all multipoles

⇒ At large  $p$  values, enhancement due to  $\delta a_1^P$ :  $\mathcal{L}_L(p)$

⇒ Overall response depends on relative  $\mathcal{L}_L(p)$  vs  $\mathcal{T}_L(p)$  contributions

# “proton”/“neutron” 1b+2b response

2b currents naturally involve neutrons and protons at the same time:

In the  $a_1 = a_0$  “proton” case, neutrons contribute through 2b currents, at all  $p$

$$S(0) \propto \left| \frac{a_0 + a_1(1 + \delta a_1)}{2} \langle S_p \rangle + \frac{a_0 - a_1(1 + \delta a_1)}{2} \langle S_n \rangle \right|^2,$$

$\langle S_n \rangle \gg \langle S_p \rangle$ , dramatic increase in  $S_p(u)$

Structure Factor, “neutron” and “proton”, dominated by the odd species

# “proton”/“neutron” 1b+2b response

2b currents naturally involve neutrons and protons at the same time:

In the  $a_1 = a_0$  “proton” case, neutrons contribute through 2b currents, at all  $p$

$$S(0) \propto$$

$$\left| \frac{a_0 + a_1(1 + \delta a_1)}{2} \langle S_p \rangle + \frac{a_0 - a_1(1 + \delta a_1)}{2} \langle S_n \rangle \right|^2,$$

$\langle S_n \rangle \gg \langle S_p \rangle$ , dramatic increase in  $S_p(u)$

Structure Factor, “neutron” and “proton”, dominated by the odd species

# Application to experiment: XENON100

Our calculations used by XENON100 Collaboration to set limits on WIMP-nucleus cross-sections ( $\sigma$ )

XENON100 obtained world best limits ( $\sigma$  above limit excluded) for Spin-Dependent scattering with “neutron” couplings

# Summary and Outlook

Nuclear Matrix Elements key for experiments on Fundamental Symmetries

Chiral EFT hadronic currents: 2b currents correct standard operators

State-of-the-art nuclear ISM structure calculations: good spectroscopy

## Matrix Elements for Neutrinoless $\beta\beta$ decay

- 2b currents reduce (quench) Matrix Elements in 15% – 40%
- $p$ -dependence of GT reduction predicted ( $0\nu\beta\beta$  less quenched than GT)
- Benchmark of ISM and EDF NMEs at spherical/seniority zero limit

## Structure Factors for Spin-Dependent elastic WIMP scattering off nuclei

- Reduce the isovector dominant Structure Factor
- Strong increase in sub-dominant Structure Factor at low  $p$

## Outlook

- Consistent calculations based on chiral EFT forces and currents
- Better understand correlations in  $0\nu\beta\beta$  decay NMEs
