Outlook

- Brief (experimental) review on low-energy fission
- Low-energy fission in "new" regions of the Nuclear Chart
- Beta Delayed Fission (β DF) - what it is and why?
- β DF $^{194,196}\text{At}$, ^{202}Fr at ISOLDE (CERN)
- Further plans

Outlook

- Many nuclear properties change far from stability line (e.g. disappearance of traditional magic numbers; appearance of new shell gaps; halos, skins...

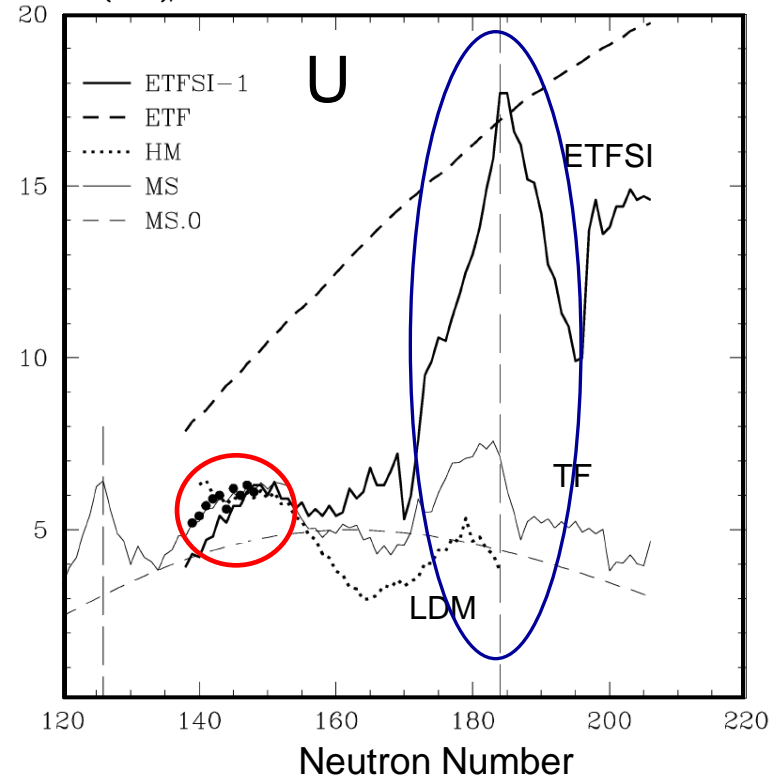

- What happens to fission far from stability, e.g. on the extremely proton-rich or neutron-rich side (relevant for r-process)?

- Not simple to answer, as to fission these nuclei at low excitation energy ($E^* \sim B_f$) is a very challenging task as none of them fissions from g.s.

Fission Barrier Calculations for the r-process nuclei

Full symbols – experimental data
Lines – calculations (LDM,TF, ETFSI)

A. Mamdouh et al. NPA679 (2001), 337

- Good agreement between $B_{f,cal}$ and $B_{f,exp}$ for nuclei close to stability
- Large disagreement far of stability (both on n-def. and n-rich sides)
- Need **measured** fission data far of stability to 'tune' fission models

A Detour:

What can one learn with a rate of 1 fission/h?

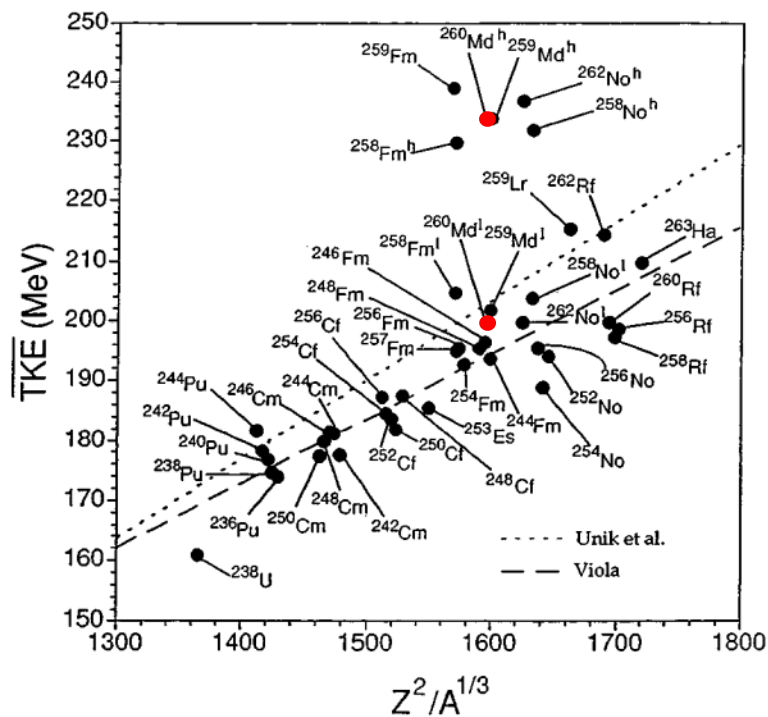

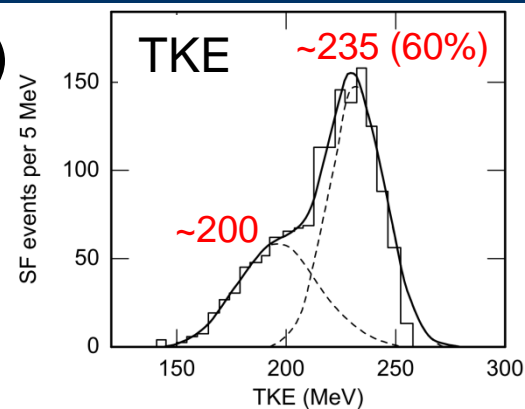

OR

What can one learn from ~100-1000 fission events?

Bimodal Fission of ^{260}Md ($T_{1/2} \sim 32$ d)

J. F. Wild et al., Phys. Rev. C4, 640, 1990

- $^{22}\text{Ne} + ^{254}\text{Es}$ ($T_{1/2} = 276$ d) \rightarrow ^{260}Md (α transfer reaction)
- 34 irradiations in a **2.5 months irradiation period**
- Collection of recoils on a foil
- Radiochemical separation of **~ 3000 ^{260}Md atoms**
- Deposited on a very thin foil
- **98 days of counting with Si and neutron detectors**
- **1207 singles fission fragments, 905 coincident (TKE),**
- **Neutron multiplicity (as a function of TKE)**

- **Two-humped TKE**
- **Two components in masses**
- **High TKE – low ν**
- **Low TKE – high ν**

Bimodal Fission

Total Kinetic Energy (TKE)

Masses

Mass components as a function of TKE

Evidence for bimodal fission: strong deviation of TKE from a single Gaussian
Detailed fission fragments energy measurements are "A MUST"

Experimental information on low-energy fission

Nuclei with measured charge/mass split (RIPL-2 + GSI)

Heavy Actinides, $N/Z \sim 1.56$: **predominantly asymmetric**; spontaneous fission, fission isomers

Experimental information on low-energy fission

Nuclei with measured charge/mass split (RIPL-2 + GSI)

Region of our interest I: **beta-delayed fission** of $A \sim 180-200$
 $N/Z \sim 1.22-1.3$: Tl, Bi, At, Fr
ISOLDE(CERN)

Region of our interest II: **beta-delayed fission** of nuclei with
 $A \sim 230$, $N/Z \sim 1.6$: Fr, Pa, Ac

symmetric;

Beta-Delayed Fission

Discovery: $^{232,234}\text{Am}$ (1966, Dubna)

- Two step process: β decay followed by fission
- Low-energy fission ($E^* \sim 3-12$ MeV, limited by Q_{EC})
e.g. ^{180}Tl : $Q_{EC} = 10.4$ MeV, $B_{f,calc} = 9.8$ MeV
- Relatively low angular momentum of the state
e.g. ^{180}Tl : $l = 4$ or 5 (some cases: up to 10)

β DF branch

$$P_{\beta DF} = \frac{N_{\beta DF}}{N_{\beta}}$$

Three regions to search for β DF

Necessary conditions for β DF to occur:

- $Q_{EC}(\text{Parent}) \sim B_f(\text{Daughter})$ [$Q_{EC} - B_f > -2 \text{ MeV}$]
- Beta-branching ratio $b_\beta > 0$

Beta-Delayed Fission

Discovery: $^{232,234}\text{Am}$ (1966, Dubna)

β DF branch

$$P_{\beta DF} = \frac{N_{\beta DF}}{N_{\beta}}$$

$P_{\beta\text{DF}}$ Probability: Extraction of fission barriers?!

$$P_{\beta\text{df}} = \frac{\int_0^{Q_\beta} F(Q_\beta - E) S_\beta(E) \frac{\Gamma_f(E)}{\Gamma_f(E) + \Gamma_\gamma(E)} dE}{\int_0^{Q_\beta} F(Q_\beta - E) S_\beta(E) dE}$$

Need to know S_β !?
(next slide)

$\frac{\Gamma_f}{\Gamma_{\text{tot}}} = \frac{\Gamma_f}{\Gamma_f + \Gamma_\gamma}$ -ratio of the fission and total widths of excited levels in daughter (Γ_n is not important for neutron-deficient nuclei)

$$\Gamma_\gamma = \frac{9.7 \times 10^{-7} \times T^4 \times \exp(E/T)}{2\pi\rho}, \quad \rho - \text{level density, } T - \text{temperature}$$

$$\Gamma_f = \frac{1}{2\pi\rho} \left\{ 1 + \exp\left[\frac{2\pi(B_f - E)}{\hbar\omega_f} \right] \right\}^{-1} \quad \text{-inverted parabola approximation}$$

^{180}Hg : More surprises?

How does ^{180}Hg fission at higher excitation energies?

- $^{36}\text{Ar} + ^{144}\text{Sm} \rightarrow ^{180}\text{Hg}^*$ $E^* = 34\text{-}66\text{ MeV}$
- 2010-2012: JAEA, Tokai

- 2010-2012, JAEA
- $^{36,40}\text{Ar} + ^{144,154}\text{Sm} \rightarrow ^{180-194}\text{Hg}^*$ $E^* = 30\text{-}100\text{ MeV}$
- $^{36,40}\text{Ar} + ^{142}\text{Nd} \rightarrow ^{178,182}\text{Pt}^*$ $E^* = 30\text{-}100\text{ MeV}$

• Approved $^{90}\text{Zr} + ^{90}\text{Zr} \rightarrow ^{180}\text{Hg}^*$ ($E^* \sim 15\text{ MeV}$)

Even at $E^* = 66\text{ MeV}$: asymmetric mass split with $A_1 \sim 100$, $A_2 \sim 80$

Two types of asymmetry: what's the difference?

PHYSICAL REVIEW C **86**, 024610 (2012)

Contrasting fission potential-energy structure of actinides and mercury isotopes

Takatoshi Ichikawa,¹ Akira Iwamoto,² Peter Möller,³ and Arnold J. Sierk³

Conclusions: The mechanism of asymmetric fission must be very different in the lighter proton-rich mercury isotopes compared to the actinide region and is apparently unrelated to fragment shell structure. Isotopes lighter than ^{192}Hg have the saddle point shielded from a deep symmetric valley by a significant ridge. The ridge vanishes for the heavier Hg isotopes, for which we would expect a qualitatively different asymmetry of the fragments.

'Brownian Metropolis Shape Motion'

based on J. Randrup and P. Moller, PRL 106, 132503 (2011)

Calculated fission yields of neutron-deficient mercury isotopes

Peter Möller^{1,*}, Jørgen Randrup², and Arnold J. Sierk¹

¹Theoretical Division, Los Alamos National Laboratory, Los Alamos, New Mexico 87545, USA

²Nuclear Science Division, Lawrence Berkeley National Laboratory, Berkeley, California 94720, USA

(Dated: November 21, 2011)

The recent unexpected discovery of asymmetric fission of ¹⁸⁰Hg following the electron-capture decay of ¹⁸⁰Tl has led to intense interest in experimentally mapping the fission-yield properties over more extended regions of the nuclear chart and compound-system energies. We present here a first calculation of fission-fragment yields for neutron-deficient Hg isotopes, using the recently developed Brownian Metropolis shape motion treatment. The results for ¹⁸⁰Hg are in approximate agreement with the experimental data. For ¹⁷⁴Hg the symmetric yield increases strongly with decreasing energy, an unusual feature, which would be interesting to verify experimentally.

PACS numbers: 25.85.-w, 24.10.Lx, 24.75.+i

FIG. 4. (Color online) Minima, saddles, major valleys, and ridges in the 5D potential-energy surface of ¹⁸⁰Hg (see text). At the last plotted point on the fission barrier, $(Q_2/b)^{(1/2)} \approx 11$, the asymmetry of the shape is $A_H/A_L = 108/72$.

'Improved Scission-Point Model'

PHYSICAL REVIEW C **86**, 044315 (2012)

Mass distributions for induced fission of different Hg isotopes

A. V. Andreev, G. G. Adamian, and N. V. Antonenko
Joint Institute for Nuclear Research, 141980 Dubna, Russia

(Received 20 June 2012; revised manuscript received 6 September 2012; published 11 October 2012)

With the improved scission-point model mass distributions are calculated for induced fission of different Hg isotopes with even mass numbers $A = 180, 184, 188, 192, 196, \text{ and } 198$. The calculated mass distribution and mean total kinetic energy of fission fragments are in good agreement with the existing experimental data. The asymmetric mass distribution of fission fragments of ^{180}Hg observed in the recent experiment is explained. The change in the shape of the mass distribution from asymmetric to more symmetric is revealed with increasing A of the fissioning ^AHg nucleus, and reactions are proposed to verify this prediction experimentally.

- Inter-fragment distance is not fixed and calculated.
- values of $\sim 0.5\text{-}1$ fm result (Wilkins – fixed at 1.4 fm)
- Mass symmetry/asymmetry doesn't change as a function of E^* (up to $E^* \sim 60$ MeV) – good for future experiments
