3 Toward class 3 PESs

Microscopic description of the fission

Two-step approach :

Production of microscopic potential energy surfaces (PES)

- Hartree-Fock-Bogoliubov code using a two-center oscillator basis
- effective nucleon-nucleon interaction Gogny D1S
- N-dimensional PESs
- results : statical properties of the fragments
- Wave packet propagation
 - TDGCM method with GOA
 - initial state : eigenstate of an extrapolated first well
 - microscopic inertia tensor (GCM)
 - results : statistical properties of the fragments

Microscopic description of the fission Self-consi	stent problems	Toward class 3 PESs	Conclusions
000000 000000	00000	000	00

Formalism - HFB2CT

$$\delta \langle \varphi | \hat{H} - \lambda_N \hat{N} - \lambda_Z \hat{Z} - \sum_i \lambda_i \hat{Q}_{i0} | \varphi \rangle = 0$$

Constrained Hartree-Fock-Bogoliubov method:

- D1S Gogny parametrization
- self-consistent mean and pairing fields
- two-center harmonic oscillator basis

Constraints:

• neutron and proton numbers N et Z

$$egin{array}{rcl} \langle arphi | \hat{\pmb{N}} | arphi
angle &=& \pmb{N} \ \langle arphi | \hat{\pmb{Z}} | arphi
angle &=& \pmb{Z} \end{array}$$

- q₁₀ to avoid spurious center of mass motion
- multipolar moments q_{i0}

$$\langle arphi | \hat{oldsymbol{Q}}_{i0} | arphi
angle = oldsymbol{q}_{i0}$$

Microscopic description of the fission	Self-consistent problems	Toward class 3 PESs	Conclusions
000000	0000000000	000	00

Formalism - TDGCM + GOA

General GCM state with N different degrees of freedom $\{q_1, \ldots, q_N\}$:

$$|\psi(t)\rangle \equiv \left(\prod_{i}^{N}\int dq_{i}
ight)f(q_{1},\ldots,q_{N},t)|\phi(q_{1},\ldots,q_{N})
angle$$

Variational principle:

$$\frac{\partial}{\partial f^*} \int_{t_1}^{t_2} \langle \psi(t) | \left(\hat{H} - i\hbar \frac{\partial}{\partial t} \right) | \psi(t) \rangle = 0$$

Using the Gaussian Overlap Approximation (GOA), we obtain a Schrödinger-like equation:

$$\hat{H}_{\text{coll}}g(t) = i\hbar \frac{\partial}{\partial t}g(t)$$

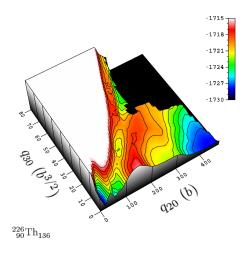

with

$$\hat{H}_{\text{coll}} = -\frac{\hbar^2}{2} \sum_{i,j}^{N} \frac{\partial}{\partial q_i} B^{ij} \frac{\partial}{\partial q_j} + \hat{V}$$

0000000 000	00000000	000	00

Problem 1 - Convergence

- Problem: the HFB solver does not converge.
- Consequence: the HFB solution is bad.
- Symptom: the convergence quantity is too high.

Problem 2 - Minimization

- Problem: the HFB solver converges to a local minimum.
- Consequence: the HFB solution is bad.
- Symptom: none at the time of calculation.

Problem 3 - Discontinuity

- Problem: two solutions close in the constraint deformation subspace are not close in the full deformation space.
- Consequence: a dynamical description using these points is missing a part of the physics (wrong barrier, saddle point, ...).
- Symptom: none easily visible.

The density-distance operator

We define the density-distance operator

$$\mathcal{D}_{
ho
ho^{\prime}}(\ket{\psi},\ket{\psi^{\prime}})\equiv\int\mathrm{d} au^{3}ert
ho(ec{r})-
ho^{\prime}(ec{r})ec{r})ec{r}$$

where $\rho(\vec{r})$ and $\rho'(\vec{r})$ are the total local densities of the states $|\psi\rangle$ and $|\psi'\rangle$.

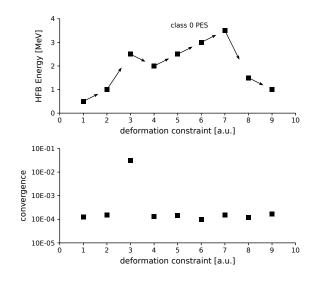

4-lines long algorithm to clean a PES

- all solutions with a too high convergence value are marked as "bad",
- all solutions with a too high maximum density distance value AND with their energy being higher than the corresponding partner's energy are marked as "bad",
- all solutions marked as "bad" are recalculated from the neighboring solution with the lowest energy that has not been used for the same calculation before,
- recalculate the density distances and restart.

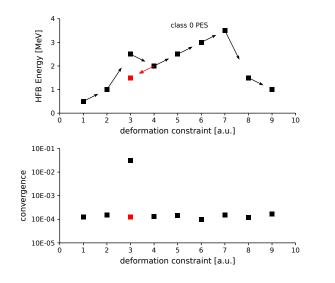

- this algorithm can be used during or after the production of a *N*-dimensional PES.
- if there is no fatal convergence problem and if all valleys have been discovered, the result is at least a class 2 PES.

Important remark

We call a good point a solution that does not change when taking a bigger deformation subspace with the same symmetries.

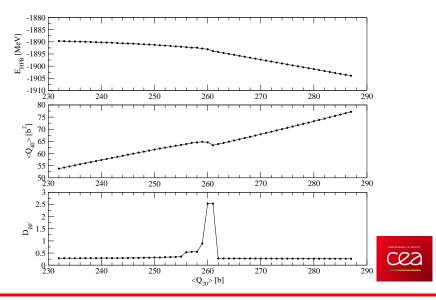

If there has been no fatal convergence problem and if all valleys have been discovered,

- a class 2 PES can have wrong or missing saddle points,
- a class 3 PES has only good points (minima, saddle points, etc...).

Class 3 PESs

Continuous regular mesh ?

- dimension of a class 3 PES: *N* = 1, 2, 3, 4, 5, 6, ... ?
- regular mesh + hypercube + N > 2 = huge number of points N_p
- dimension of the TDGCM + GOA hamiltonian matrix: N²_p

Use a sparse mesh !

- no hypercube, focus on the physics in any dimension
- optimal number of points
- solve the TDGCM + GOA equation with FEM

Solving the TDGCM + GOA on a sparse mesh

Generalized Finite Element Method

- N-dimensional delaunay triangulation
- piecewise linear function approximation
- very good numerical stability (Runge-Kutta + Jacobi method)
- analytical vertices manipulation (derivation, integration...)

Conclusions

- Publishing class 2 PESs should be the minimum (4-lines !).
- Dynamical considerations are not valid on class 0,1,2 PESs.
- A class 3 *N*-dimensional PES has the same good saddle points, paths... as any extended (N + x)-PES.

Microscopic description of the fission	Self-consistent problems	Toward class 3 PESs	Conclusions
000000	0000000000	000	0

Perspectives - fission description

In a near future, we plan to have

- a fully-automatic production of class 3 sparse N-PESs,
- a code to solve the TDGCM + GOA equation on sparse N-PESs with FEM (almost done, cf. video).
