

LA-UR-13-27602

# Fundamental and Applied Nuclear Fission Research at LANL

**Patrick Talou**

T-2, Nuclear Physics Group, Los Alamos National Laboratory  
New Mexico, USA

**INT 13-3**  
**Quantitative Large Amplitude Shape Dynamics:**  
**Fission and Heavy Ion Fusion**

# Talk Outline

---

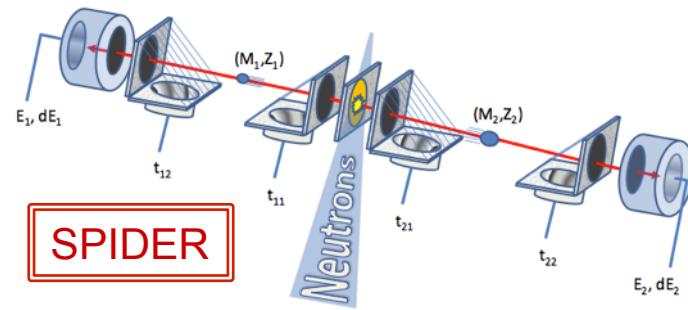

- **Introduction:** a “Renaissance” of Nuclear Fission Research at LANL
  - New theoretical efforts, new experimental devices, why?
  - Both fundamental and applied science is being carried out
- **Goals**
  - From phenomenological and adjusted to more fundamental and predictive
  - “Putting it together”
- **Topics of research**
  - Fission cross-sections
  - Fission fragment yields
  - Post-scission: prompt fission neutrons and  $\gamma$  rays;  $\beta$ -delayed n and  $\gamma$  rays.
  - Fission recycling in nuclear astrophysics
  - UQ associated with all data to be delivered

# “Renaissance” of Nuclear Fission Research at LANL

- Los Alamos Neutron Science Center:
  - Time-Projection Chamber, DANCE, Chi-Nu, SPIDER
- T-2 Theory & Modeling efforts
  - Fission cross sections, fission fragment yields, prompt fission neutrons and  $\gamma$  rays,  $\beta$ -delayed neutrons and  $\gamma$  rays, astrophysics reaction networks
- X-CP Transport Calculations
- Uncertainty Quantification

Time-Projection Chamber

INT 13-3, Oct. 1, 2013, Seattle, WA

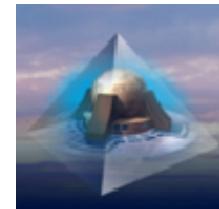

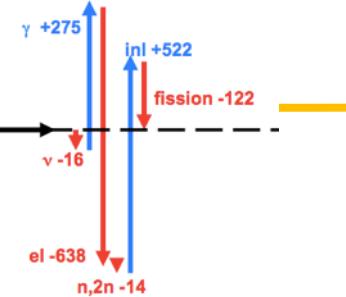

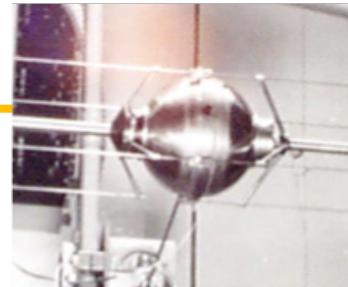

Slide 4

 NNSA

# Why?

- **We don't know everything yet!... Duh...**
  - Not such a trivial statement
  - Quality of evaluated nuclear data— oversold
  - Compensating errors in integral benchmarks (e.g.,  $k_{\text{eff}}$  in Jezebel)
  - Lack of predictive power
- **New applications and new requirements for existing applications**
  - Future reactors (new fuel compositions, new geometries, etc.)
  - Existing fuel cycle (safety, waste management, etc.)
  - Non-proliferation, attribution, etc.
  - Astrophysics (reaction networks)
  - Uncertainty Quantification
- **New capabilities: Experimental & Computing**
- **Fundamental & Applied Research**

## Two overarching goals

---

From  
**Phenomenological and Adjusted**  
to  
**more Fundamental and Predictive**

### “Putting it all together”

- Fission cross sections
- Fission fragment yields
- Fission fragment angular distributions
- Prompt fission neutrons
- Prompt fission photons
- ( $\beta$ -delayed neutrons and photons)

*(right now, a different model for each fission data type)*

---

# FISSION CROSS SECTIONS

Operated by Los Alamos National Security, LLC for NNSA

UNCLASSIFIED

INT 13-3, Oct. 1, 2013, Seattle, WA

Slide 7

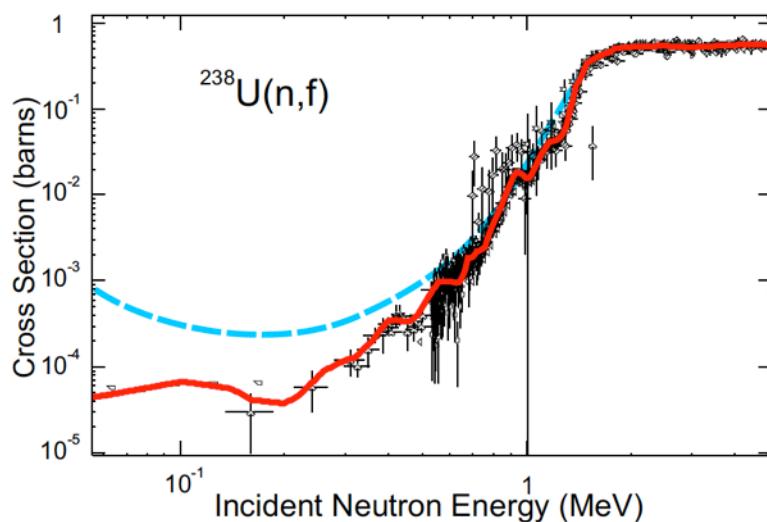

# Fission Cross Sections

## Status of Evaluated Models & Data

### ■ Fission Cross Sections

- Compound nucleus (Hauser-Feshbach) reaction theory
- Non-statistical corrections (pre-equilibrium, width fluctuation corrections, ...)
- Multi-modal fission
- Approximate treatments of class-II states
- Fission barrier heights and widths, level densities, etc., fitted to measured cross sections

M.Herman et al., Nuclear Data Sheets **108**, 2655 (2007)

IF EID

### Limitations?

- One-dimension
- **Fitted** barrier heights, widths, transition states, level densities, ...
- **Not predictive**
- **Lack of consistency** between different isotopes and entrance channels, e.g.,  $(\gamma,f)$ ,  $(t,pf)$

# Fission Transition States

- Original idea of A. Bohr (1959) following the experimental observation of strong anisotropies in fission fragment angular distributions

$$d\sigma_f(\theta) = \sum_J \sum_{M=-J}^J \sigma(JM) \sum_{K=0}^J \frac{\Gamma_f(JK)}{\Gamma(J)} \frac{2J+1}{4} \left( |\mathcal{D}_{MK}^J(\theta)|^2 + |\mathcal{D}_{M-K}^J(\theta)|^2 \right) \sin\theta d\theta$$

s-wave neutrons on even target:  $W(KI) = \frac{1}{4}(2I+1) \left[ |d_{1/2,K}^I(\theta)|^2 + |d_{-1/2,K}^I(\theta)|^2 \right]$

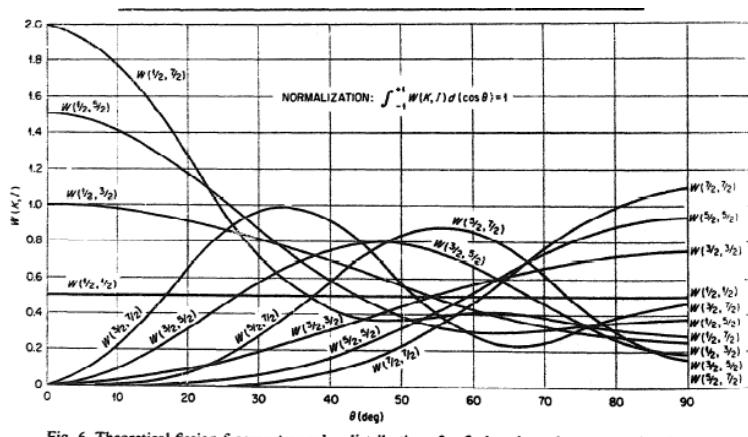

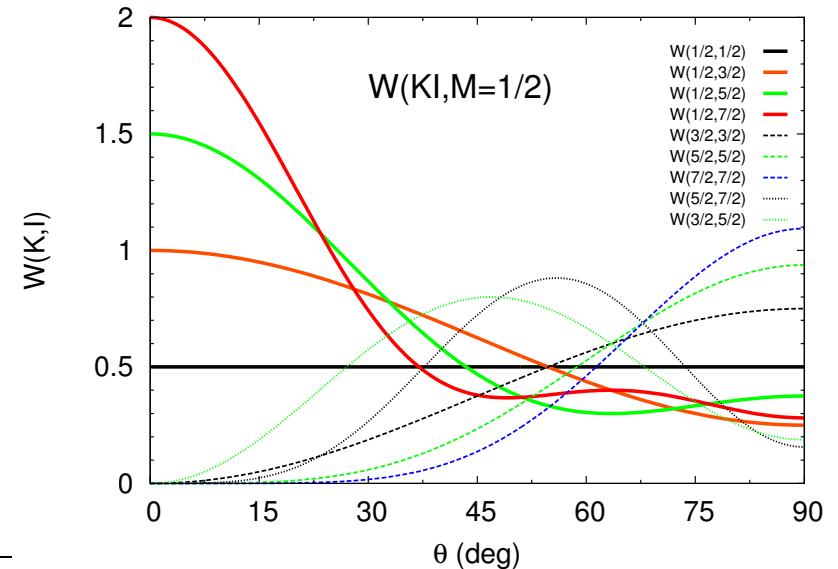

Fig. 6. Theoretical fission fragment angular distributions for fission through pure rotational states,  $W(KI)$ .

Lamphere, Nucl. Phys. **A38**, 661 (1962)

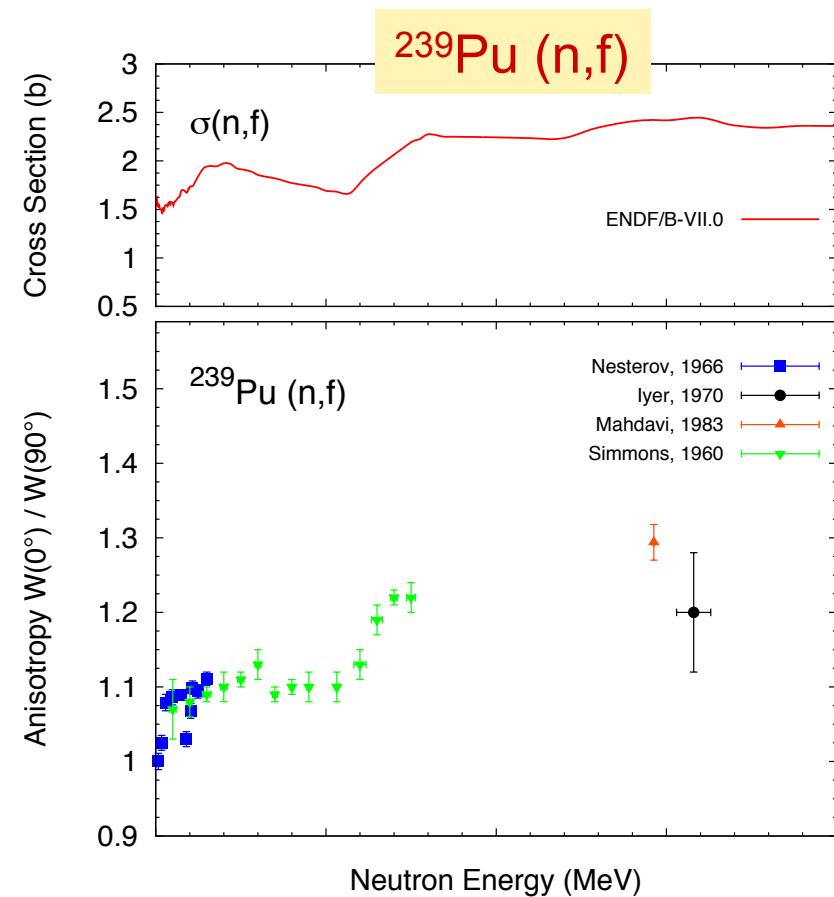

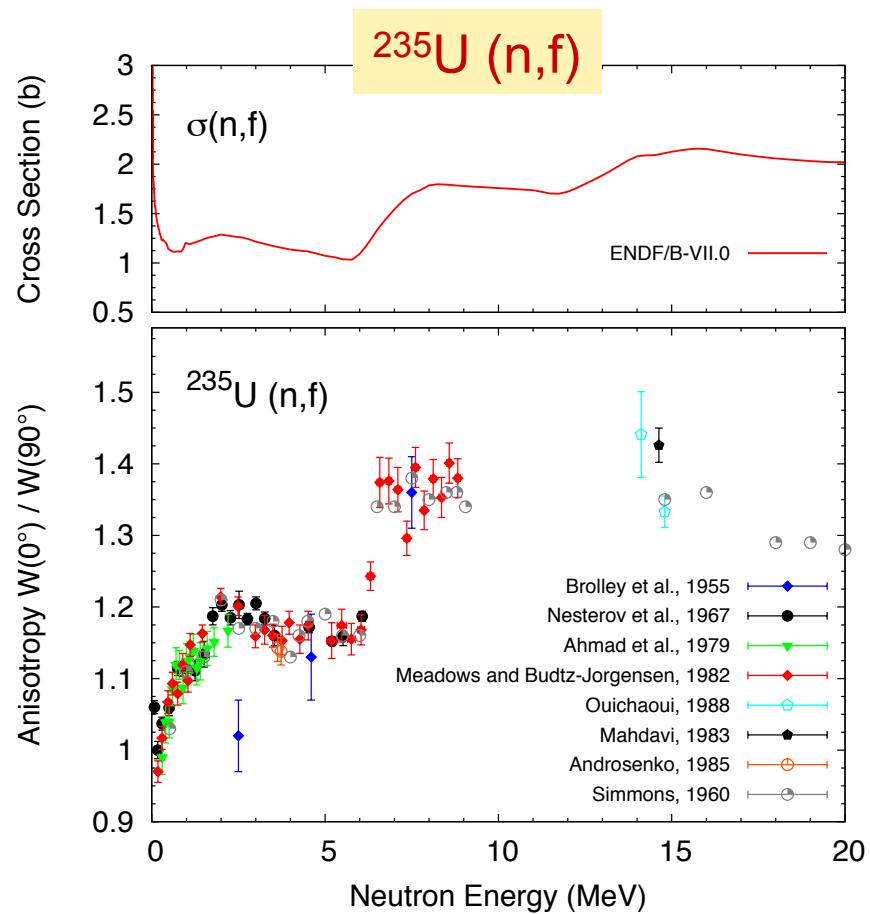

EST.1943

Operated by Los Alamos National Security, LLC for NNSA

INT 13-3, Oct. 1, 2013, Seattle, WA

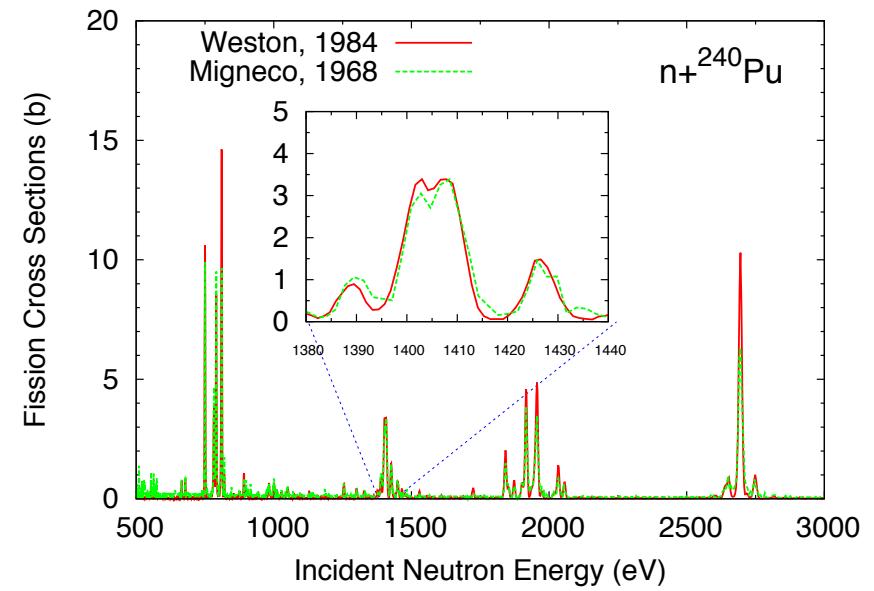

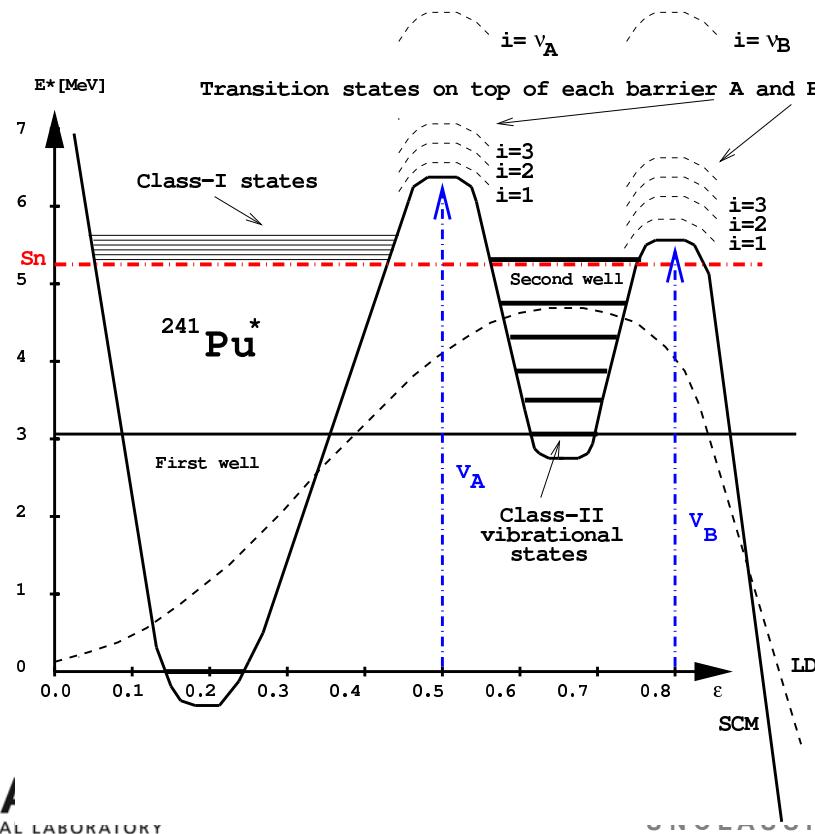

# Anisotropy with increasing $E^*$

# R-Matrix Approach to Fission Cross Section Modeling

- S.Bjørnholm and J.E.Lynn, Rev. Mod. Phys. **52**, 725 (1980)
- Presence of 2<sup>nd</sup> well → Coupling between class-I and class-II states

## R-Matrix (cont'd)

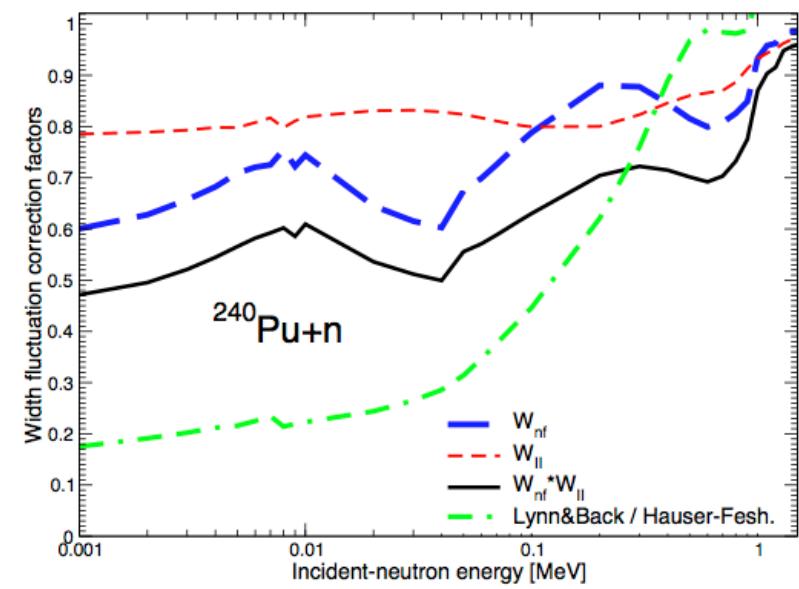

- Hauser-Feshbach formula has to be modified

$$\sigma_{nf} = \sum_{J^\pi} \sigma_c^{J^\pi} \times \frac{T_f}{\sum_c T_c} \times W_{cf} \times W_{II}$$

Width Fluctuation  
Correction Factor

Correction Factor  
due to 2<sup>nd</sup> well

- Many approximate solutions exist
- Most accurate approach:  
Monte Carlo sampling of Class-I and Class-II states characteristics, and of their coupling matrix elements
- Consistent approach throughout a suite of Pu isotopes: O.Bouland, J.E.Lynn, P.Talou, to appear in Phys. Rev. C (2013)

---

# FISSION FRAGMENT YIELDS

Operated by Los Alamos National Security, LLC for NNSA

UNCLASSIFIED

INT 13-3, Oct. 1, 2013, Seattle, WA

Slide 13

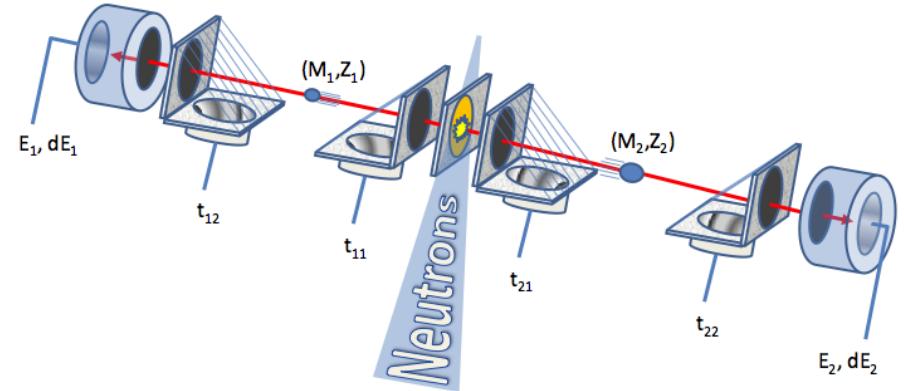

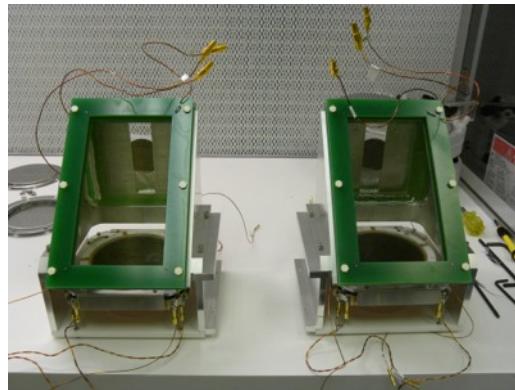

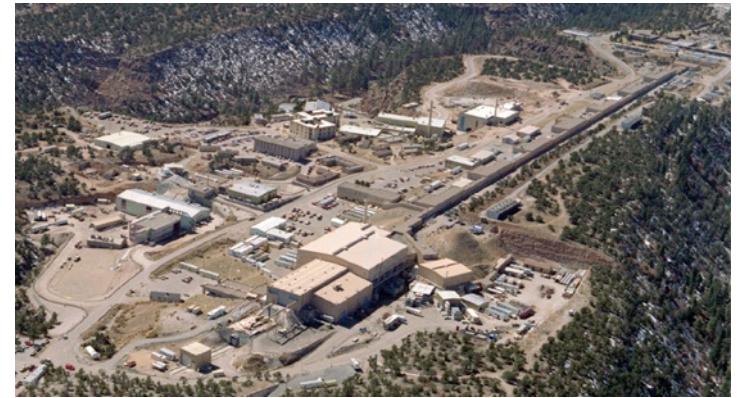

---

See talks by Arnie Sierk, Jørgen Randrup, Peter Möller,  
Noël Dubray, Nicolas Schunck, etc.

# SPectrometer for Ion DETERmination in fission Research (SPIDER) at LANSCE- F.Tovesson et al.

- 2E-2v method
- Time-of-Flight
- Ionization chambers to measure E of FF (0.5-1% energy resolution); dE/E to estimate Z
- Multiple detectors to increase efficiency

---

# PROMPT FISSION NEUTRONS AND PHOTONS

Operated by Los Alamos National Security, LLC for NNSA

UNCLASSIFIED

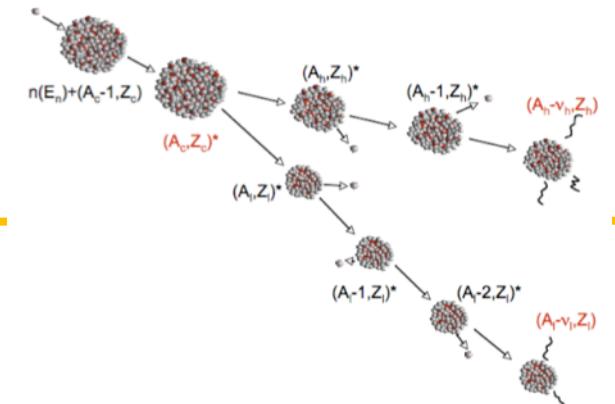

INT 13-3, Oct. 1, 2013, Seattle, WA

Slide 16

# Prompt Fission Neutrons and Photons

## Status of Evaluated Models & Data

- **Prompt fission neutrons**

- “Los Alamos” or “Madland-Nix” model  
D.G.Madland and J.R.Nix, Nucl. Sci. Eng. 81, 213 (1982)
- Fits with Watt spectra

- **Prompt fission photons**

- Experimental data only

- **Recent review of existing experimental data**

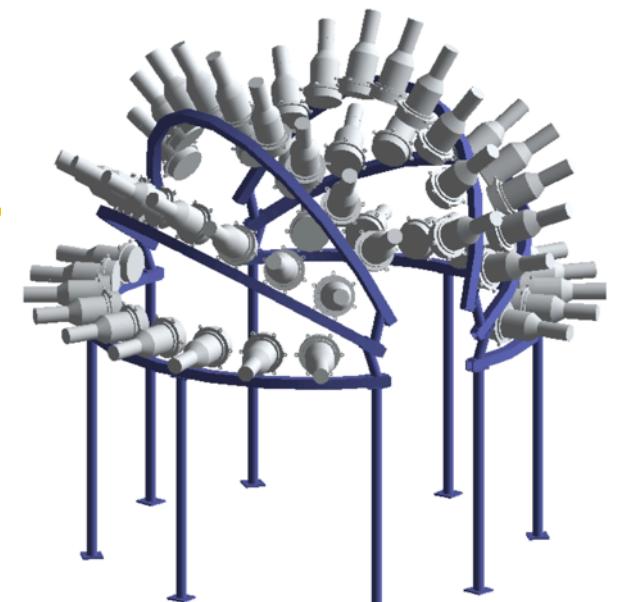

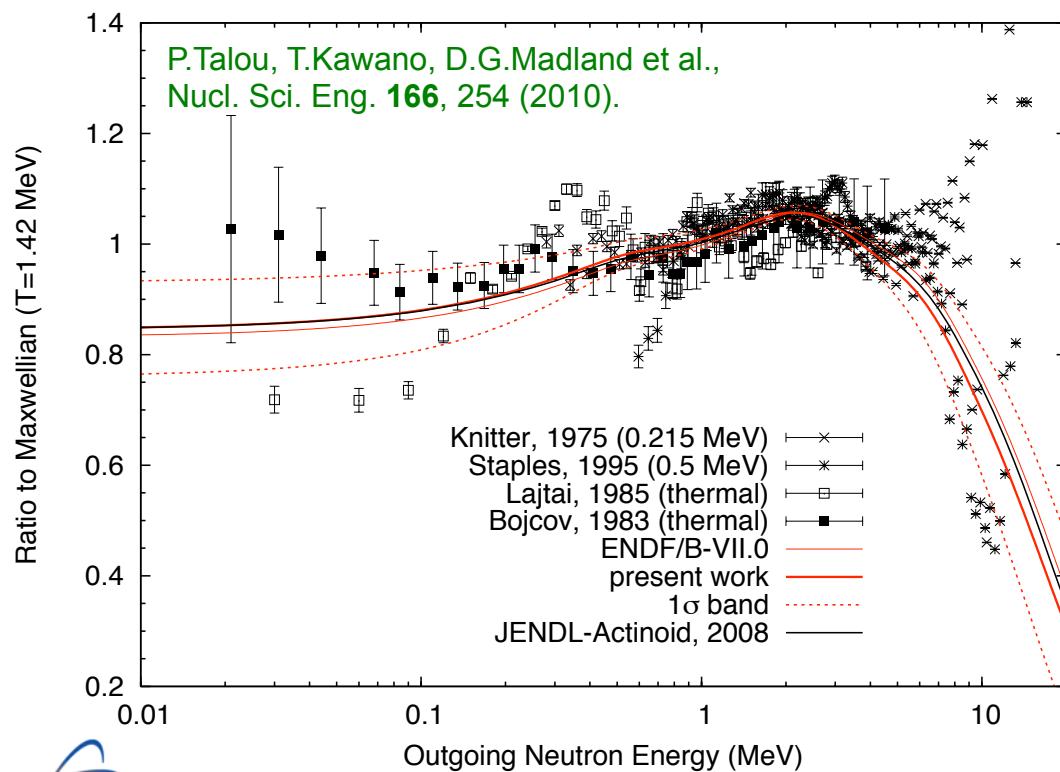

- Neudecker *et al.*, LA-UR-13-24743, revealed many problems with past experiments

- **International efforts underway**

- IAEA Coordinated Research Project on “Prompt fission neutron spectra of actinides”, IAEA Secretary: R.Capote-Noy.
- CIELO International Evaluation Project

## Prompt Fission Neutron Spectrum (PFNS)

- Chi-Nu experimental efforts to measure low- and high-energy tails of the PFNS

- ❖  $n+^{239}\text{Pu}$  PFNS for  $E_n$  from 0.5 to 30 MeV
- ❖ 5% uncertainty between 50 keV and 12 MeV emitted neutron energy
- ❖ Double ToF experiment + angular info
- ❖ ~ 60 Liquid scintillators +  ${}^6\text{Li}$ -glass detectors

# Theoretical & Evaluation Work on PFNS

- Original and extended versions

D.G.Madland and J.R.Nix, Nucl. Sci. Eng. **81**, 213 (1982)

$$N(E) = \frac{1}{2\sqrt{E_f}T_m^2} \frac{1}{1+b/3} \int_{(\sqrt{E}-\sqrt{E_f})^2}^{(\sqrt{E}+\sqrt{E_f})^2} d\epsilon \sigma_c(\epsilon) \sqrt{\epsilon} \left( 1 + b \frac{(E - \epsilon - E_f)^2}{4\epsilon E_f} \right) \int_0^{T_m} dT k(T) T \exp(-\epsilon/T)$$

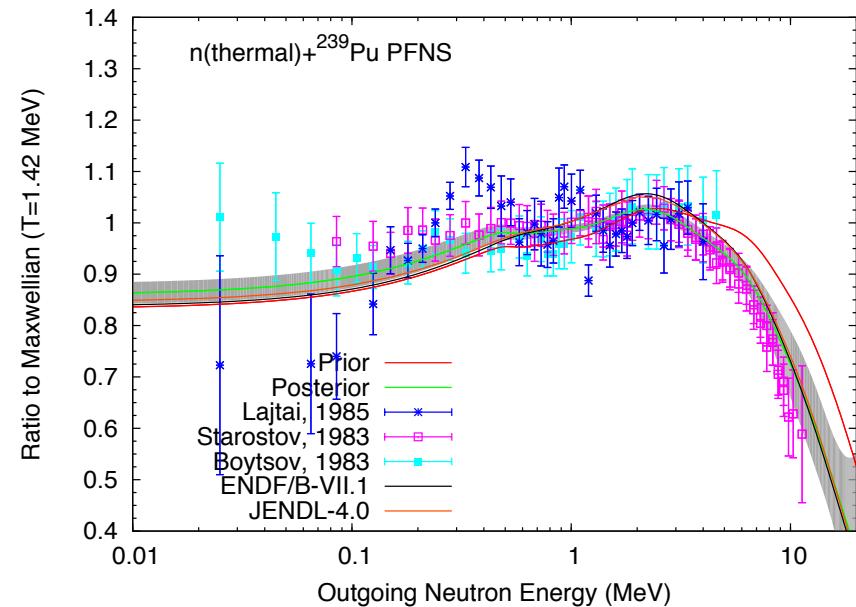

- Bayesian statistical technique to combine experimental data and model calculations

M.E.Rising, P.Talou, T.Kawano and A.K.Prinja, Nucl. Sci. & Eng. **175**, 81-93 (2013).

- Very successful model used in most evaluated libraries

- Limitations:

- Only average spectrum and multiplicity
- Strong physical assumptions
- Difficult to extend to other quantities

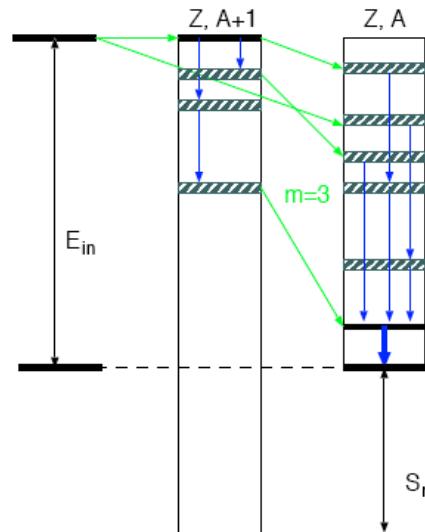

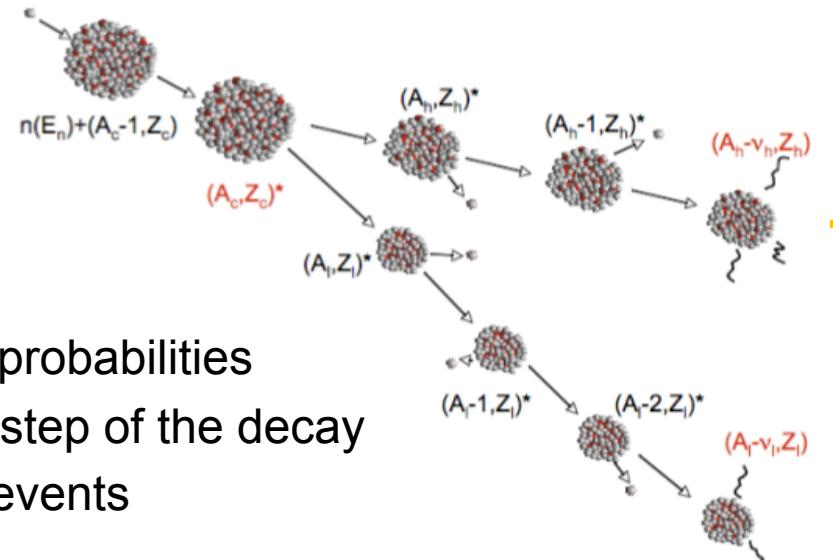

# Monte Carlo Hauser-Feshbach Simulations

---

- Each fission fragment = Compound nucleus with  $E^* \sim 10\text{-}15 \text{ MeV}$
- Hauser-Feshbach statistical theory
  - Two main open emission channels: **neutrons** and **photons**  
Light charged particle emissions are negligible due to Coulomb barrier
- LANL Code: CGM/F
  - Deterministic and Monte Carlo modes
  - Written in C++, MPI-parallel instructions
  - Similar to **DICEBOX** at lowest excitation energies
  - Other *similar* codes: **FREYA** (LBNL-LLNL), **FIFRELIN** (CEA), **GEF** (Schmidt), ...
- Calculated Quantities:
  - Deterministic: Average  $\gamma$ -ray spectrum and multiplicity
  - Monte Carlo: Set of histories with exact decay path → distributions, correlations, etc.

# CGMF: The Mechanics

- Hauser-Feshbach Statistical Theory
- Calculate neutron and photon emission probabilities
- Sample probability distributions at each step of the decay
- Record Monte Carlo histories of fission events
- Perform statistical analyses of results

❖ CGMF –i 98252 –e 0.0 –n 100000 → output: history file:

```

```

$Z, A, U_i, J_i, \pi_i, KE_i, N_v, N_\gamma, \dots$   
 Neutrons:  $\varepsilon_{cm}^1, \theta_{cm}^1, E_{lab}^1, \theta_{lab}^1, \varepsilon_{cm}^2, \theta_{cm}^2, E_{lab}^2, \theta_{lab}^2, \dots$   
 Gammas:  $\varepsilon_{cm}^1, \theta_{cm}^1, E_{lab}^1, \theta_{lab}^1, \varepsilon_{cm}^2, \theta_{cm}^2, E_{lab}^2, \theta_{lab}^2, \dots$

times 100,000 times 2, in this case

# Prompt Neutron and Photon Emissions

## ■ Gamma emission:

- Gamma-ray strength function  $f_{Xl}(\epsilon_\gamma)$
- Transmission coefficients:

$$T_{Xl}(\epsilon_\gamma) = 2\pi\epsilon_\gamma^{2l+1} f_{Xl}(\epsilon_\gamma)$$

- E1, M1, E2 only

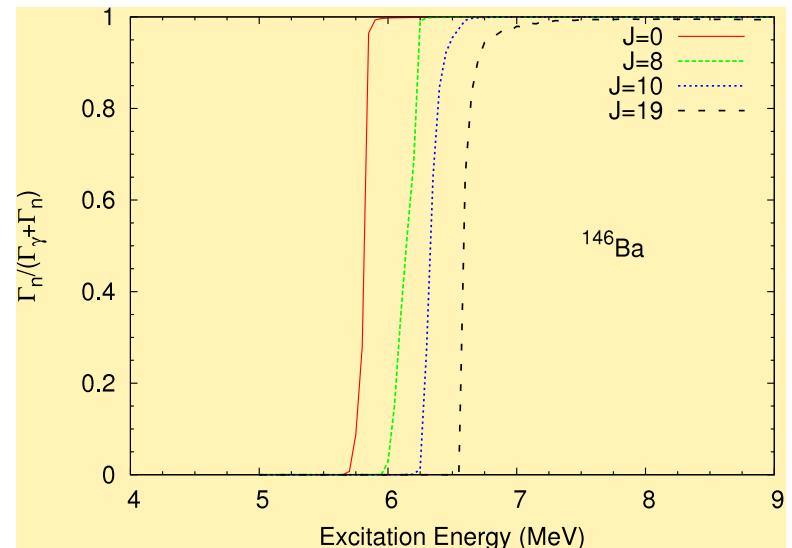

## ■ Neutrons:

- Optical model calculations  $T_n = 1 - |S_{nn}|^2$
- Koning-Delaroche (spherical) OMP, 2003
- Transmission coefficients:

## ■ Emission Probabilities:

$$P(\epsilon_\gamma)dE \propto T_\gamma(\epsilon_\gamma)\rho(Z, A, E - \epsilon_\gamma)dE$$

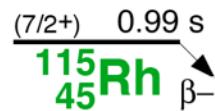

$$P(\epsilon_n)dE \propto T_n(\epsilon_n)\rho(Z, A - 1, E - \epsilon_n - S_n)dE$$

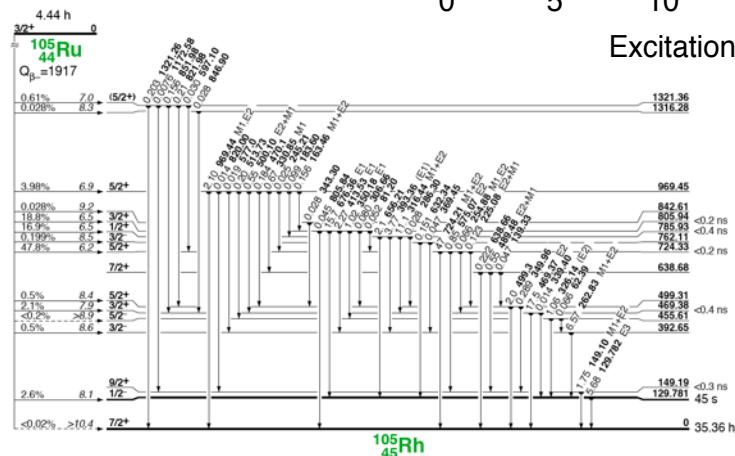

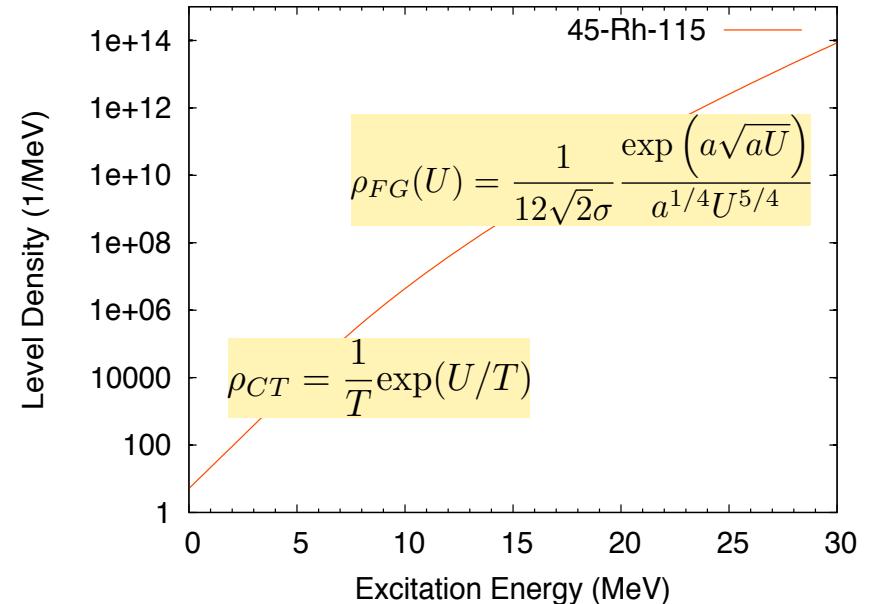

# Level Density & Low-Lying Nuclear Structure

- **Gilbert-Cameron-Ignatyuk**
  - Constant-temperature at low  $E^*$
  - Fermi-gas at higher  $E^*$
- **Poorly known low-lying levels for many isotopes of interest**

Most probable fission fragment for A=115

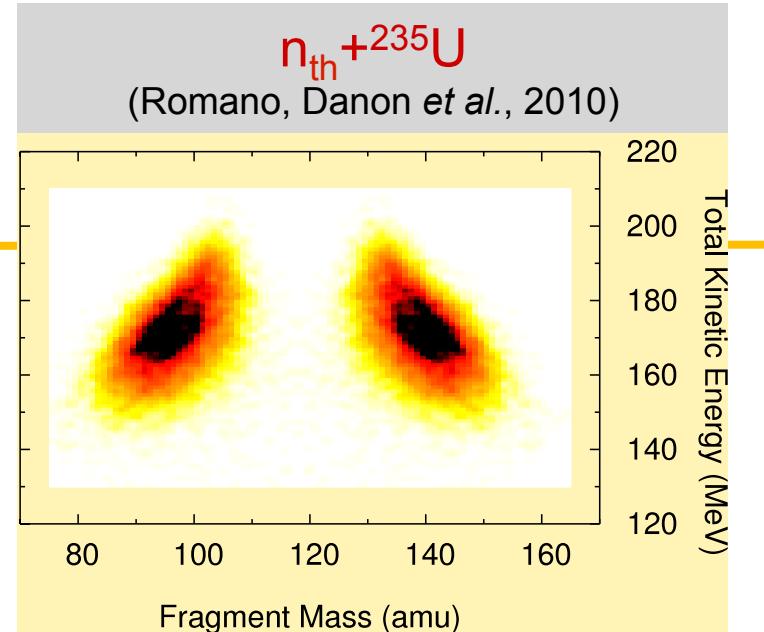

► Stable isotope  $^{105}\text{Rh}$  ?

# Primary Fission Fragment Yields

- **Theoretical Predictions:**
  - FRFLDM + random walk (Randrup-Möller) + Langevin (Sierk), ...
  - HFB: Younes *et al.* (LLNL), Dubray *et al.* (CEA-BRC), ...
- **For now, use of experimental data**
  - $Y(A, TKE)$  often inferred from post-neutron emission fragment yields
  - Very limited data available, mostly for thermal neutrons and spontaneous fission
  - Questionable results at higher excitation energies (lack of  $\langle v \rangle(A, TKE)$  knowledge)
- **Initial conditions:**
  - $\rho_i(U, J, \pi)$
  - Excitation energy partitioning between the two fragments
  - Production of fragment angular momentum

# Fission Fragment Initial Conditions in **Excitation Energy** and **Angular Momentum**

---

## ■ Initial Excitation Energies

- For a given fragment pair

$$TXE = Q - TKE = (E_{int}^* + E_{def}^* + E_\perp^*)_{L,H}$$

- Sharing of TXE between light and heavy fragments  $\rightarrow R_T = T_L/T_H$

## ■ Initial Angular Momentum Distributions

- Total angular momentum conservation
- Initial distribution in fragments:

$$\vec{J}_{tot} = \vec{J}_L + \vec{J}_H + \vec{l}$$

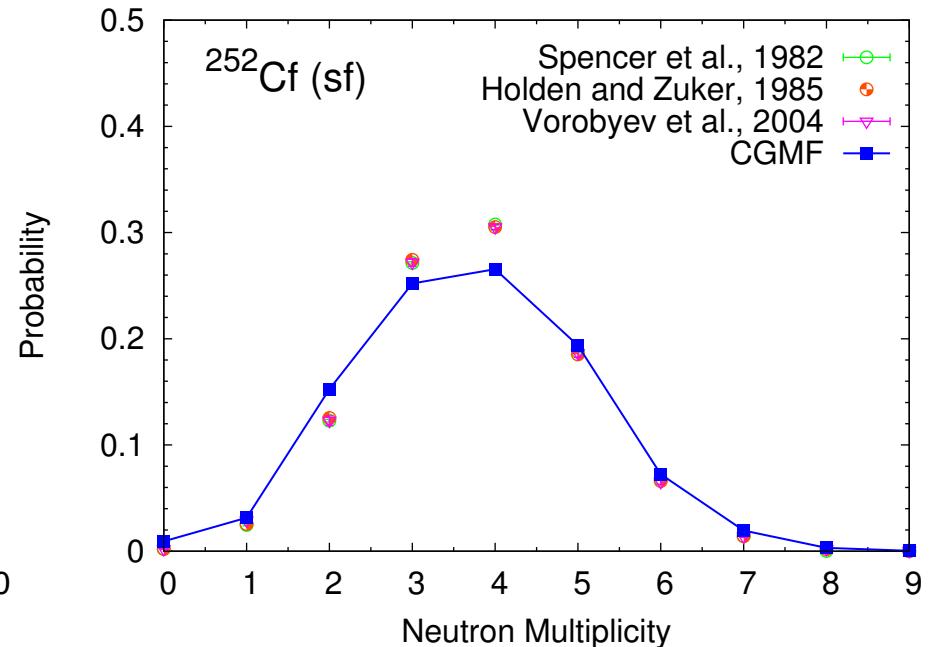

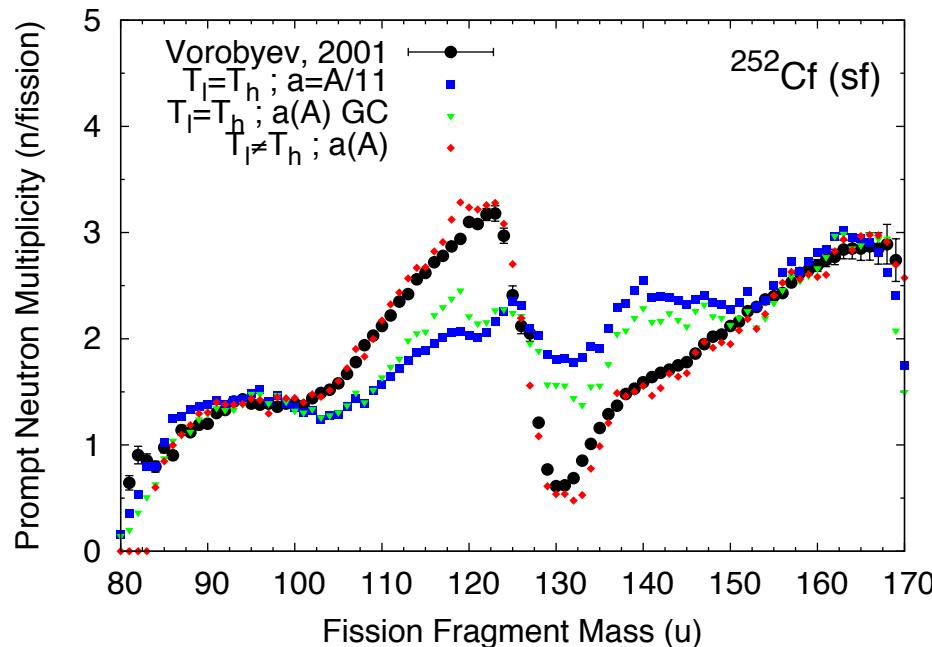

$$P(J) \propto (2J+1)\exp\left[-\frac{J(J+1)}{2B^2(Z,A,T)}\right]$$

with  $B^2(Z,A,T) = \alpha \frac{\mathcal{I}_0(A,Z)T}{\hbar^2}$

$I_0$  is the moment of inertia of the fragment (A,Z) in its ground-state.

# Prompt Neutron Multiplicity $\langle\nu\rangle(A)$ and $P(\nu)$

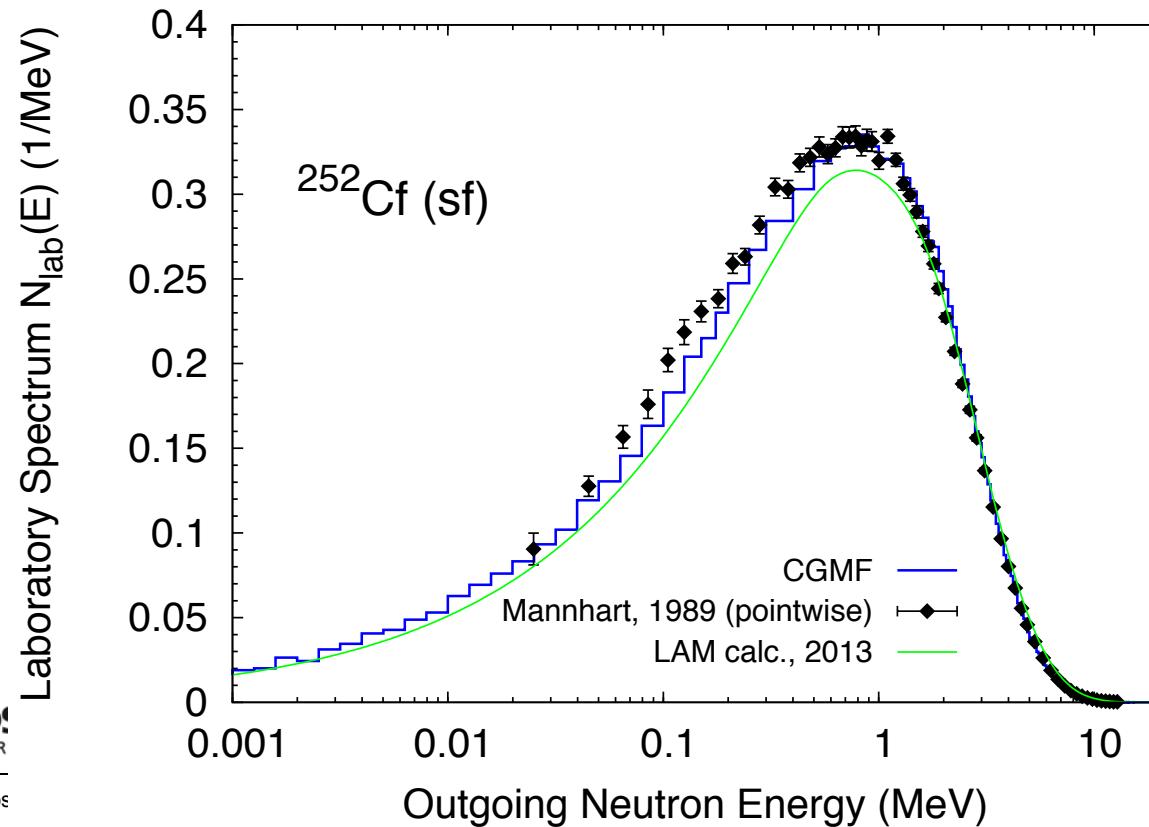

Example of  $^{252}\text{Cf}$  (sf)

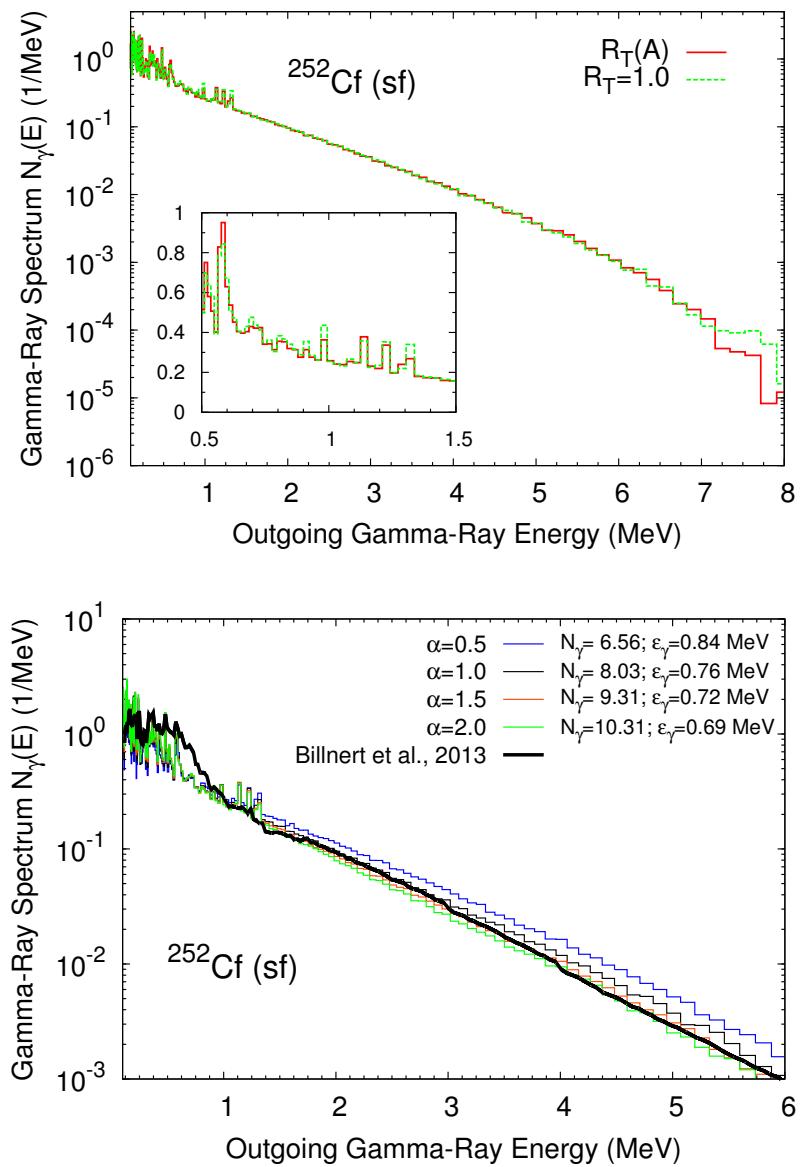

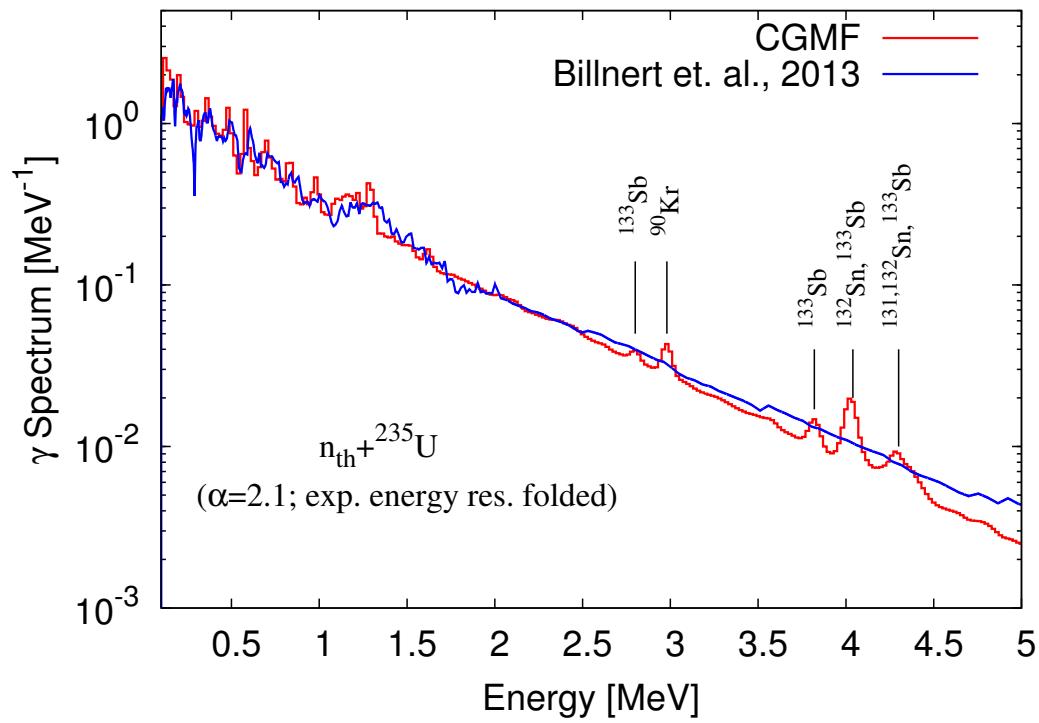

$$\langle\nu\rangle_{\text{calc}} = 3.78 \text{ vs. } \langle\nu\rangle_{\text{std}} = 3.7606$$

# Average Prompt Fission Neutron Spectrum

- $^{252}\text{Cf}$  (sf) PFNS is a “**standard**” (Mannhart, 1989)
- Difficulty to reproduce low-outgoing energy tail
- CGMF calculations better at low-energy but too soft at high energies

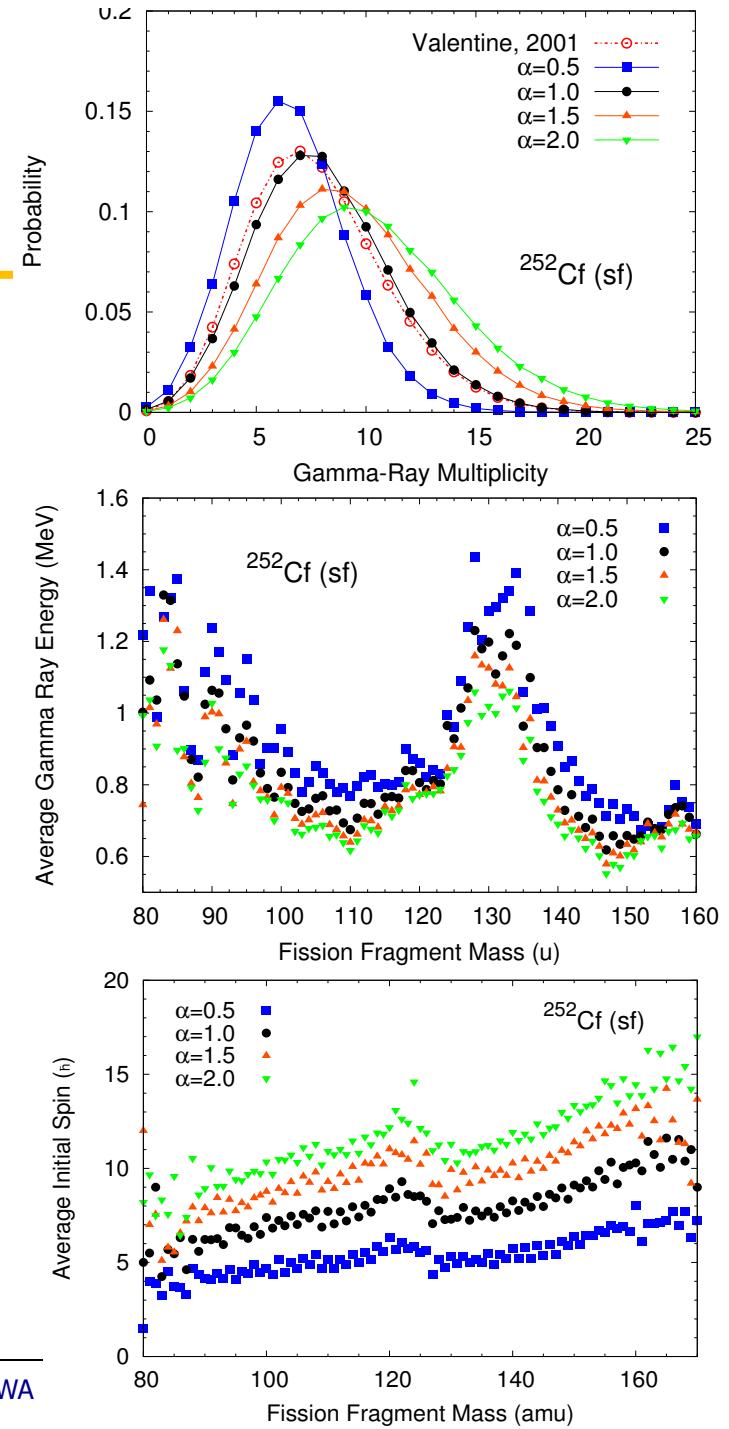

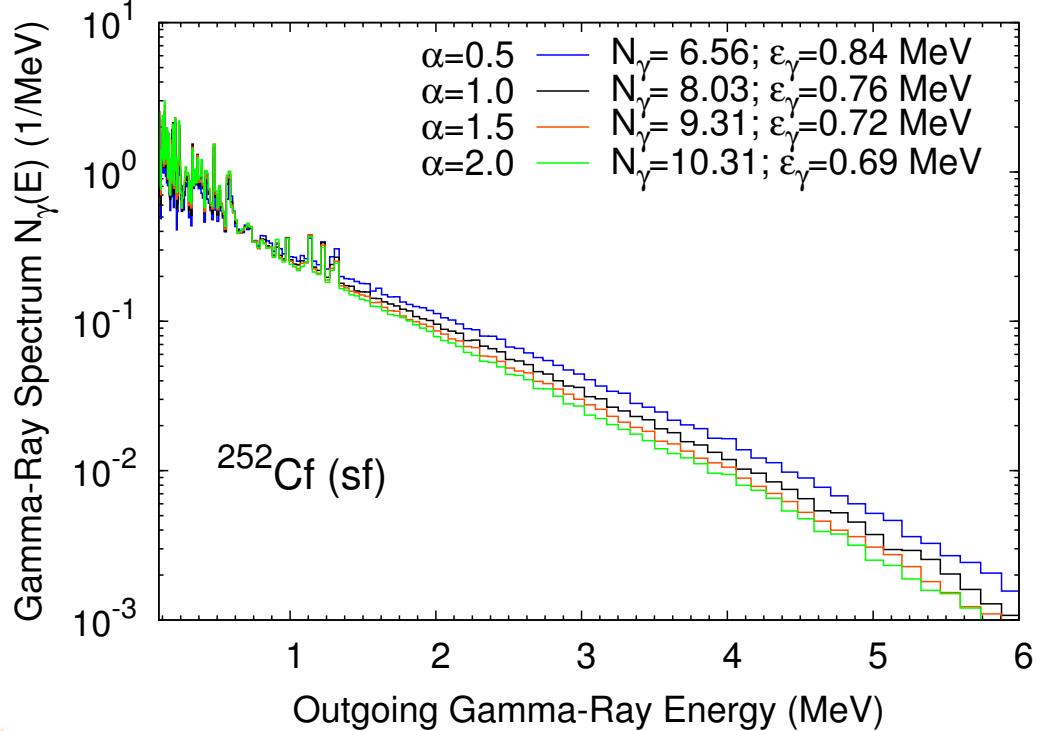

# Prompt Photon Spectrum

## Impact of $\alpha$ ( $\langle J_i \rangle$ )

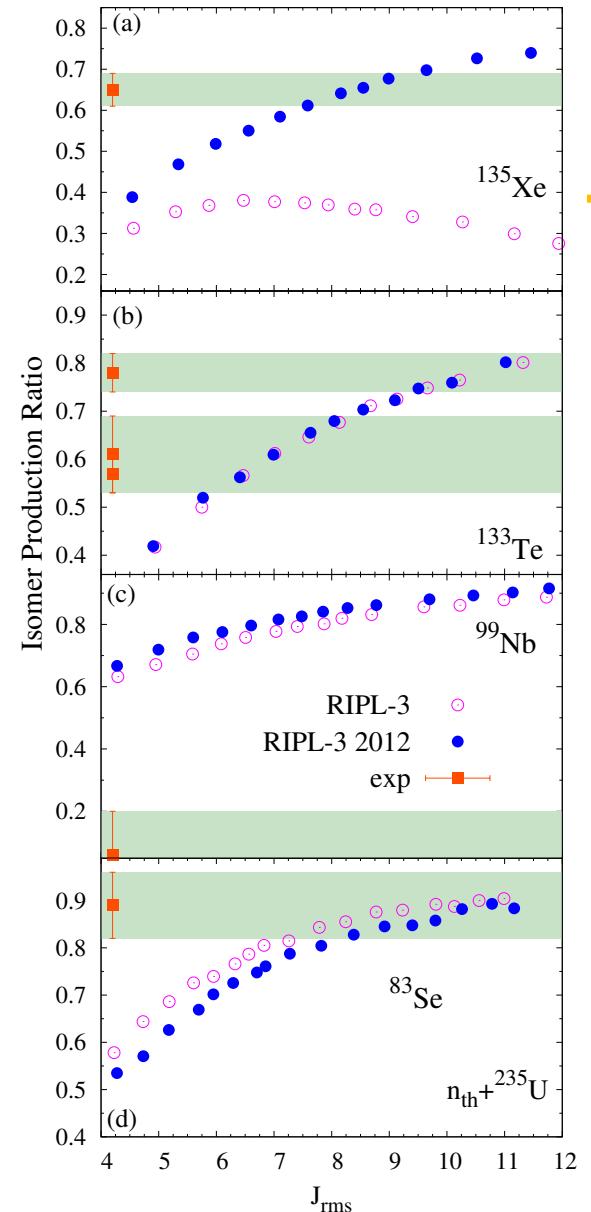

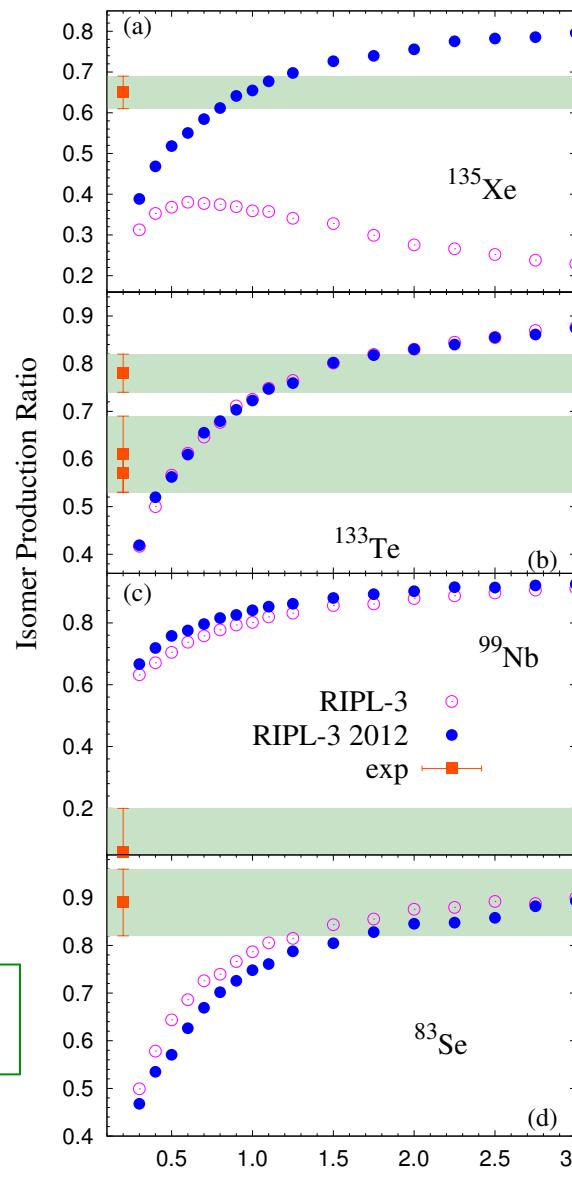

- The  $\alpha$ -parameter impacts directly the spin-dependent initial population of the fragments.

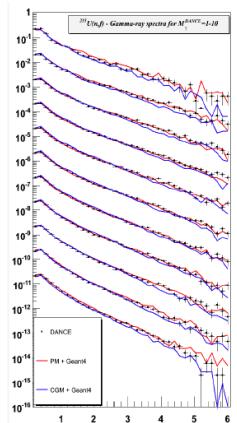

# Isomeric Ratios

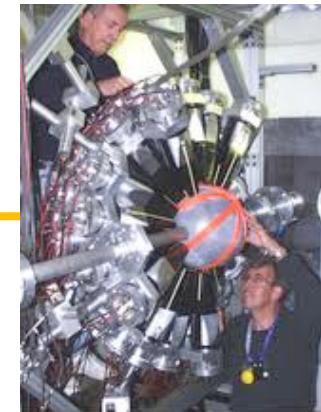

- Using measured ratios of isomer to ground-state to infer initial  $J_{rms}$
- Very mixed results
- Very sensitive to (often unknown) detailed nuclear structure

Stetcu, Talou, Kawano, Jandel,  
to appear in Phys. Rev. C (2013)

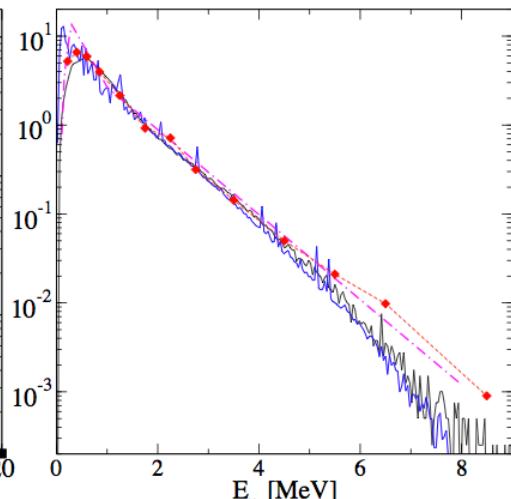

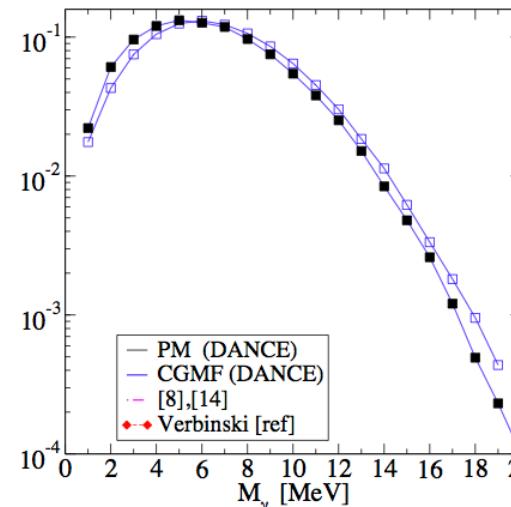

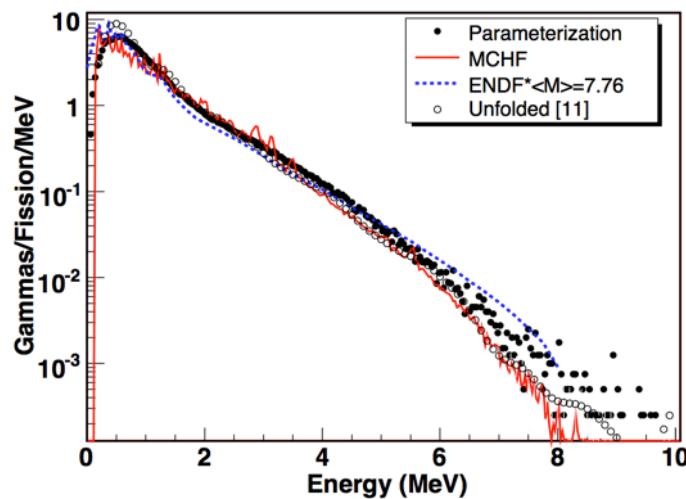

## Prompt Gamma Rays in DANCE

$^{239}\text{Pu}$  (n,f)

J.Ullmann et al.,

"Prompt Gamma-Ray Production in Neutron-Induced Fission of  $^{239}\text{Pu}$ ", Phys. Rev. C 87, 044607 (2013).

M.Jandel et al.,

"Prompt Gamma-Ray Emission in Neutron-Induced Fission of  $^{235}\text{U}$ ," to be submitted to PRC.

# Final Remarks

---

- A lot of research work on nuclear fission being performed
- For both fundamental research and applied needs
- Some examples:
  - **Fission Cross Sections**
    - Fundamental: determine fission probabilities from robust determination of fission paths characteristics (level densities, transition states, K-mixing, etc.)
    - Applied: need predictive, consistent, and accurate capabilities (strong impact on integral benchmarks)
  - **Fission Fragment Yields**
    - Fundamental: stringent tests for static and dynamic fission models
    - Applied: fission product yields as a diagnostic for Pu burnup
  - **Prompt Fission Neutrons and Photons**
    - Fundamental: compound nucleus physics, dynamic vs. evaporation, scission neutrons?
    - Applied: strong impact on benchmarks (part of the compensating error picture)
