## Heavy-Nucleus Structure for Dark Matter

### J. Engel

December 8, 2014

### Nuclear Operators

EFT (Anand, Fitzpatrick, Haxton), to leading order in *<sup>q</sup>*:

$$
C_{J=0M} \rightarrow \sum_{i=1}^{A} 1(i)
$$
\n
$$
L_{J=1M}^{5} \sim T_{J=1M}^{el} \rightarrow \sum_{i=1}^{A} \sigma_{1M}(i)
$$
\n
$$
T_{J=1M}^{mag} \rightarrow \frac{q}{m_N} \sum_{i=1}^{A} \ell_{1M}(i)
$$
\n
$$
L_{J=0M} \rightarrow \frac{q}{m_N} \sum_{i=1}^{A} \vec{\sigma}(i) \cdot \vec{\ell}(i)
$$
\n
$$
L_{J=2M} \sim T_{J=2M}^{el} \rightarrow \frac{q}{m_N} \sum_{i=1}^{A} \left[ \vec{r}(i) \otimes \left( \vec{\sigma}(i) \times \frac{1}{i} \vec{\nabla} \right) \right]_{2M}
$$

The last of these, as well as higher-*<sup>q</sup>* extensions of the rest, take you out of valence shell. **Q:** An issue for the shell model?

## Nuclear Operators

EFT (Anand, Fitzpatrick, Haxton), to leading order in *<sup>q</sup>*:

$$
C_{J=0M} \rightarrow \sum_{i=1}^{A} 1(i)
$$
\n
$$
L_{J=1M}^{5} \sim T_{J=1M}^{el} \rightarrow \sum_{i=1}^{A} \sigma_{1M}(i)
$$
\n
$$
T_{J=1M}^{\text{mag}} \rightarrow \frac{q}{m_N} \sum_{i=1}^{A} \ell_{1M}(i)
$$
\n
$$
L_{J=0M} \rightarrow \frac{q}{m_N} \sum_{i=1}^{A} \vec{\sigma}(i) \cdot \vec{\ell}(i)
$$
\n
$$
L_{J=2M} \sim T_{J=2M}^{el} \rightarrow \frac{q}{m_N} \sum_{i=1}^{A} \left[ \vec{r}(i) \otimes \left( \vec{\sigma}(i) \times \frac{1}{i} \vec{\nabla} \right) \right]_{2M}
$$

The last of these, as well as higher-*<sup>q</sup>* extensions of the rest, take you out of valence shell. **Q:** An issue for the shell model?

Chiral EFT, presumably, can give you handle on the body corrections to these operators.

$$
\n
$$
\vec{J}_t(\vec{r}) = -\frac{i}{2}(\vec{\nabla} - \vec{\nabla}')_i s_{t,j}(\vec{r}, \vec{r}')|_{\vec{r} = \vec{r}'} \qquad \vec{j}_t(\vec{r}) = \sum_{ij = xyz} J_{t,ij}^2
$$
\n
$$
\vec{J}_t(\vec{r}) = -\frac{i}{2}(\vec{\nabla} - \vec{\nabla}') \times \vec{S}_t(\vec{r}, \vec{r}')|_{\vec{r} = \vec{r}'}
$$

## Effective Interaction from Energy Functional

$$
\bar{V}_{\text{Skyrme}}^{\text{eff}} = (a_0 + b_0 \vec{\sigma} \cdot \vec{\sigma}' + c_0 \vec{\tau} \cdot \vec{\tau}' + d_0 \vec{\sigma} \cdot \vec{\sigma}' \vec{\tau} \cdot \vec{\tau}') \delta(\vec{r} - \vec{r}')
$$
\n
$$
+ (a_1 + b_1 \vec{\sigma} \cdot \vec{\sigma}' + c_1 \vec{\tau} \cdot \vec{\tau}' + d_1 \vec{\sigma} \cdot \vec{\sigma}' \vec{\tau} \cdot \vec{\tau}')
$$
\n
$$
\times (\vec{k}^{\dot{\tau}2} \delta(\vec{r} - \vec{r}') + \delta(\vec{r} - \vec{r}') \vec{k}^2)
$$
\n
$$
+ (a_2 + b_2 \vec{\sigma} \cdot \vec{\sigma}' + c_2 \vec{\tau} \cdot \vec{\tau}' + d_2 \vec{\sigma} \cdot \vec{\sigma}' \vec{\tau} \cdot \vec{\tau}') \vec{k} \vec{\tau} \cdot \delta(\vec{r} - \vec{r}') \vec{k}
$$
\n
$$
+ (a_3 + b_3 \vec{\sigma} \cdot \vec{\sigma}' + c_3 \vec{\tau} \cdot \vec{\tau}' + d_3 \vec{\sigma} \cdot \vec{\sigma}' \vec{\tau} \cdot \vec{\tau}') \rho_{00}^{\alpha}(\vec{r}) \delta(\vec{r} - \vec{r}')
$$
\n
$$
+ [e_3 \rho_{10}(\vec{r}) (\tau^{(0)} + \tau'^{(0)}) + g_3 \vec{s}_{00}(\vec{r}) \cdot (\vec{\sigma} + \vec{\sigma}')
$$
\n
$$
+ m_3 \vec{s}_{10}(\vec{r}) \cdot (\vec{\sigma} \tau^{(0)} + \vec{\sigma}' \tau'^{(0)})] \rho_{00}^{\alpha - 1}(\vec{r}) \delta(\vec{r} - \vec{r}')
$$
\n
$$
+ [f_3 \rho_{10}^2(\vec{r}) + h_3 \vec{s}_{00}^2(\vec{r}) + n_3 \vec{s}_{10}^2(\vec{r})] \rho_{00}^{\alpha - 2}(\vec{r}) \delta(\vec{r} - \vec{r}')
$$
\n
$$
+ (a_4 + c_4 \vec{\tau} \cdot \vec{\tau}') (\vec{\sigma} + \vec{\sigma}') \cdot \vec{k} \vec{r} \times \delta(\vec{r} - \vec{r}') \vec{k}
$$

$$
\vec{k} = -\frac{i}{2}(\vec{\nabla} - \vec{\nabla}')
$$
 acting to right,  

$$
\vec{k}^{\dagger} = \frac{i}{2}(\vec{\nabla} - \vec{\nabla}')
$$
 acting to left.

## **Basic Features of Framework**

- → All nucleons active, complete single-particle space used.<br>▶ Effective interaction (density dependent) and one-body
- mean field completely self consistent.
- $\triangleright$  Lots of work on determining good functionals, with improvements under active development.
- Phenomenology  $-$  masses, one-body observables such as  $\theta$  density distributions — reproduced well.
- $\blacktriangleright$  Some weaknesses that I won't mention. Some weaknesses that I won't mention.

### Densities Densities

## Applied Everywhere

## **Related Theories**

- Improved Skyrme DFT, derived in part from ab initio
	- $\triangleright$  Densitu-matrix expansion leads to logarithmic dependence of energy on densities.
- of energy on densities. Gogny DFT, based on finite-range density-dependent
- potential<br>Density-independent effective interactions with three (and **Density-independent encourt interactions with three (and** more, a say terms (Bennaceur, Bennaceur, Bennac, Benner, Duguet et al.)

Can expect improvement in quality.

## **Odd Nuclei**

Much of elastic response vanishes in even nuclei. Much of elastic response vanishes in even nuclei.

Core polarization in odd system:

Can do

- self-consistent odd-A calculation self-consistent odd-A calculation
- explicit RPA core polarization

The are nearly equivalent and include most of the important corrections to single-particle picture.

 $D$  exchanges and Angular-Momentum Restoration If deformed state  $|\Psi_K\rangle$  has good intr.  $J_z = K$ , angle average gives:

$$
|J,M\rangle = \frac{2J+1}{8\pi^2} \int D_{MK}^{J*}(\Omega) R(\Omega) | \Psi_K \rangle \ d\Omega
$$

Matrix elements:

$$
\langle J, M | \hat{O}_m | J', M' \rangle \propto \int \int \sum_j d\Omega \, d\Omega' \times \text{(some D-functions)}
$$

$$
\times \langle \Psi_K | R^{-1}(\Omega') \hat{O}_n R(\Omega) | \Psi_K \rangle
$$

For expectation value of, e.g., vector operator in  $J = \frac{1}{2}$  state:

$$
\langle \hat{O} \rangle = \langle \hat{O}_z \rangle_{J=\frac{1}{2},M=\frac{1}{2}} \Longrightarrow \begin{cases} \langle \hat{O} \rangle_{\text{intr.}} & \text{spherical nucleus} \\ \frac{1}{3} \langle \hat{O} \rangle_{\text{intr.}} & \text{rigidly deformed nucleus} \end{cases}
$$

Exact answer somewhere in between.

# DM-Detector Nuclei Often Have Complex Structure

## *⇐*<sup>=</sup> Potential-energy surface in *<sup>β</sup>*-*<sup>γ</sup>* plane Nomura, Shimizu, Otsuka, PRC 81, 044307 (2010).

*⇐*<sup>=</sup> Potential-energy surface in *<sup>β</sup>*-*<sup>γ</sup>* plane Nomura, Shimizu, Otsuka, PRC 81, 044307 (2010).

Similar softness, plus triantal deformation and shape coexistence, in Ge isotopes.

## Generator Coordinate

 $\sum_{i=1}^{n}$  shape transitions, shape coexistence from BMF calculations, shape coexistence from BMF calculations  $\sum_{i=1}^{n}$ nate, e.g.  $\langle Q_m \rangle \equiv \langle \sum_i r_i^2 Y_i^{2,m} \rangle$ . Minimize

$$
\langle H' \rangle = \langle H \rangle - \lambda_0 \langle Q_0 \rangle - \lambda_2 \langle Q_2 \rangle
$$

for a whole range of  $\langle Q_0 \rangle \propto \beta \cos \gamma$  and  $\langle Q_2 \rangle \propto \beta \sin \gamma$ . Then diagonalize *<sup>H</sup>* in space of *<sup>A</sup>*- and *<sup>J</sup>*-projected quasiparticle vacua with different *β, γ*.

## Generator Coordinate

 $\sum_{i=1}^{n}$  shape transitions, shape coexistence from BMF calculations, shape coexistence from BMF calculations  $\sum_{i=1}^{n}$ nate, e.g.  $\langle Q_m \rangle \equiv \langle \sum_i r_i^2 Y_i^{2,m} \rangle$ . Minimize

$$

Density dependence spoils GCM in Skyrme DFT; need alternative effective interactions or regularization procedures.

## Similar (but Harder): Schiff Moment of  $^{225}$ Ra<br>No GCM, Just Single Odd-A Mean Field

No GCM, Just Single Odd-A Mean Field

$$
S \propto \sum_i e_i r_i^2 z_i + \dots
$$

 $V_{PT}$  = perturbative *T*-violating *<sup>π</sup>*-exchange potential

Calculated <sup>225</sup>Ra density

Ground state  $|0\rangle$  has nearly-degenerate partner  $|0\rangle$  with opposite parity and same intrinsic structure, so:

$$
\langle S \rangle \approx \frac{\langle 0 | S | \bar{0} \rangle \langle \bar{0} | V_{PT} | 0 \rangle}{E_0 - E_{\bar{0}}} + c.c.
$$
 rigid limit  $\frac{1}{3} \frac{\langle S \rangle_{\text{intr.}} \langle V_{PT} \rangle_{\text{intr.}}}{E_0 - E_{\bar{0}}}$ 

reduced by tying  $\langle S \rangle_{intr.}$  to data.

## Similar (but Harder): Schiff Moment of  $^{225}$ Ra<br>No GCM, Just Single Odd-A Mean Field
